WATER RESOURCES OF HAWAII, 1912.

By C. H. PIERCE and G. K. LARRISON.

AUTHORITY FOR INVESTIGATIONS.

This volume contains results of measurements of the flow of certain streams and ditches in the Territory of Hawaii made during the calendar year 1912. The investigations leading to the report were made by the United States Geological Survey in cooperation with the Territory of Hawaii, under the general sanction of the organic law of the Survey (Stat. L., vol. 20, p. 394), which contains the following paragraph:

Provided, That this officer [the Director] shall have the direction of the geological survey and the classification of public lands and examination of the geological structure, mineral resources, and products of the national domain.

As water is the most abundant and most valuable of the minerals, the investigation of water resources is authorized under the provision for examining mineral resources. The work has been supported since the fiscal year ending June 30, 1895, by appropriations in successive sundry civil bills passed by Congress under the following item:

For gaging the streams and determining the water supply of the United States, and for the investigation of underground currents and artesian wells, and for the preparation of reports upon the best methods of utilizing the water resources.

The legislature of the Territory of Hawaii approved on March 22, 1909, "An act to promote the conservation and development of the natural resources of the Territory," which provided in substance as follows: A special tax of 2 per cent shall be levied, assessed, and collected annually on all incomes in excess of \$4,000; and all amounts so collected shall constitute a special fund to be expended only for the encouragement of immigration and the conservation of natural resources in the proportion of three-fourths for immigration and one-fourth for conservation. The conservation fund shall be used for the development, conservation, improvement, and utilization of the natural resources and shall be available for expenditure at such times and in such manner as a board of three persons appointed in accordance with section 80 of the organic act shall, with the approval of the governor, determine.

An act of April 26, 1911, amended the original act so as to extend it until December 31, 1913.

COOPERATION.

Under the authority conferred by the Federal and Territorial legislation, the Director of the United States Geological Survey and the Governor of the Territory of Hawaii entered into a cooperative agreement, dating from July 1, 1910, for "the gaging of streams and the determination of the water supply of the Territory of Hawaii."¹

The principal features of this agreement are:

1. The United States Geological Survey assumes the responsibility of gathering, analyzing, and publishing the data.
2. During the progress of the work all notes, maps, and data gathered as a result of field studies are at all times open to inspection by the representative of the Territory, and if they are not entirely satisfactory the agreement can be terminated.
3. Accounts for payment of salaries, travel and subsistence, supplies, or other expenses necessary to the completion of the work shall be rendered in the manner required by the laws and regulations of the contracting parties, and vouchers shall be preferred to either party for payment according as it may be convenient or according to the balance remaining in the respective allotments.
4. The cost of publication is borne entirely by the Geological Survey.

The Territory of Hawaii has been represented in the cooperation by the board of allotment appointed by Gov. Walter F. Frear, and consists of J. P. Cooke (chairman), Marston Campbell, and E. V. Wilcox.

SCOPE OF WORK.

The investigations of stream flow in the Territory are not complete, nor do they include all the streams that might advantageously be studied. They include, however, as many of the streams and ditches on the four larger islands as the available appropriations would allow. It is essential that records of stream flow should be kept during a period of years long enough to determine within reasonable limits the range of flow from the maximum to the minimum. The length of such a period manifestly varies for different streams. Experience has shown that the records should be kept from 5 to 20 years.

In the performance of this work an effort is made to reach the highest degree of precision possible with a rational expenditure of time and money. In all engineering work there is a point beyond which refinement is needless and wasteful, and this statement applies with especial force to stream-measurement work in Hawaii. It has been found, however, that it is possible to obtain data which are sufficiently accurate, although many of them presented in this report are for periods too short to admit of definite conclusions.

¹ The United States Geological Survey is also cooperating with the Territory of Hawaii in mapping the several islands. The whole of the island of Kauai and a part of the island of Hawaii have been mapped.

Records have been obtained at about 200 different points in the Territory, and in addition to the observations at the regular stations, miscellaneous measurements at many other places have been made. Records have also been collected regarding precipitation on areas drained by the principal streams and at a number of points in the mountains at high elevations. Evaporation losses have been studied and data obtained at various places where such losses are serious.

FIELD METHODS OF MEASURING STREAM FLOW.

BASE DATA.

In making plans for power, irrigation, municipal water supply, and other projects involving the use of water from surface streams it is necessary to have data from which both the total flow of the stream and its distribution from day to day throughout the year can be obtained. The data necessary for obtaining such information are daily gage heights, which give the fluctuations of rise and fall of the stream, and measurements of discharge at various stages, from which a rating curve and table can be prepared, giving the discharge for any stage. Such a rating is possible from the fact that so long as the conditions at the controlling point in the stream remain the same there will be the same discharge for any given gage height.

The determination of a discharge is termed a discharge measurement and points at which discharge measurements are made and records of daily fluctuations of stage are kept for determining the daily flow are termed gaging stations.

Gaging stations may be divided into two classes, known as weir stations and velocity-area stations. At weir stations the head of water on the crest of the weir is measured and the discharge computed by means of a formula. The discharge at velocity-area stations is obtained by measuring the velocity of the current and the area of the cross-section, the product of the two giving the discharge.

The data presented in this paper were collected at both weir and velocity-area stations.

WEIR MEASUREMENTS.

Unquestionably a weir properly constructed and of a type for which accurate coefficients have been determined is one of the most convenient and reliable means of measuring small quantities of water. In practice, however, weirs rarely conform to the requirements imposed by the experimenter who derived the coefficients. If the crest of the weir is sharp and clean and sufficiently high above the bottom of the leading channel and the end contractions are complete and the velocity of approach is wanting, or negligibly small, and if the head on crest is measured at a distance of 6 or 8 feet back of the

overfall, the Francis formula will give good results. On the other hand, if these essential conditions are not complied with, especially if the velocity of approach is considerable, and the contractions are imperfect, the Francis formula will not give accurate results. This is particularly true if the weir is improperly constructed and there is leakage around and under it, as is so frequently the case in practice.

Observations made on various types of weirs in Hawaii show that of the weirs in use in the Territory not all are giving accurate results. If the error is known so that corrections can be made the trouble is largely mitigated, but faulty weir records are too often accepted without investigation as to their accuracy.

VELOCITY-AREA METHOD.

The velocity-area method of measurement consists of determining the mean or average velocity of the water past a given cross-section area. The area of the cross section at right angles to the direction of flow is determined by soundings which are taken at such distances apart as will develop the contour of the stream bed. The depths are recorded and also their distances from some arbitrarily chosen initial point on one side of the stream.

The method of making the soundings depends on the size and stage of the stream. On ditches and small streams, where the depths and velocities are not large, a graduated rod may be used to advantage; on large streams, which must be measured from bridges or cables, a lead weight and sounding line must be used. The weights are of different sizes—6½, 10, or 15 pounds—according to the swiftness of the current, and are torpedo shaped, so as to offer as little resistance as possible to the moving water.

On streams with beds which are permanent or nearly so, like the South Fork of Wailua River on the island of Kauai and the Wailuku River on the island of Hawaii, a standard cross section is usually constructed from careful soundings and referred to the zero of the gage, so that the depths for any stage can be found by adding the gage height at that stage to the depths below the zero of the gage. This method is especially useful at high stages, where it is difficult to make accurate soundings.

After the cross-section area of the stream has been measured by soundings and horizontal distances, the velocity is determined at a number of points. These measurements of velocity should be made at frequent intervals across the stream and close enough to take account of any abrupt change in the velocity. For convenience, the velocities are usually observed in the same verticals at which soundings are made. On some streams fairly good measurements of velocities may be made by means of subsurface floats. This method is applicable, however, only to channels of uniform cross-section area

over a considerable distance and is very unsatisfactory for use on natural streams like those of Hawaii.¹

The velocity of flow is best determined by the current meter, which is a form of water wheel actuated by the current, and of such size and shape that it can easily be placed at any point in the stream.

The new type of penta-recording current meter consists of six cups attached to a vertical shaft which revolves on a conical hardened-steel point when immersed in moving water. The revolutions are indicated electrically. The rating, or relation between the velocity of moving water and the revolutions of the wheel, is determined for each meter by drawing it through still water for a given distance at different speeds and noting the number of revolutions for each run. From these data a rating table is prepared which gives the velocity in feet per second of moving water for any number of revolutions in a given time interval. The ratio of revolutions per second to velocity of flow in feet per second is very nearly a constant for all speeds and is approximately 0.45.

Three classes of methods of measuring velocity with current meters are in general use—multiple-point, single-point, and integration.

The two principle multiple-point methods in general use are the vertical velocity curve and 0.2 and 0.8 depth.

In the vertical velocity-curve method a series of velocity determinations are made in each vertical at regular intervals, usually about 10 to 20 per cent of the depth apart. By plotting these velocities as abscissas and their depths as ordinates and drawing a smooth curve among the resulting points, the vertical velocity curve is developed. This curve shows graphically the magnitude and changes in velocity from the surface to the bottom of the stream. The mean velocity in the vertical is then obtained by dividing the area bounded by this velocity curve and its axis by the depth. This method of obtaining the mean velocity in the vertical is probably the best known, but on account of the length of time required to make a complete measurement its use is largely limited to the determination of coefficients for purposes of comparison.

In the second multiple-point method the meter is held successively at 0.2 and 0.8 depth, and the mean of the velocities at these two points is taken as the mean velocity for that vertical. On the assumption that the vertical velocity curve is a common parabola with horizontal axis, the mean of velocities at 0.22 and 0.79 depth will give (closely) the mean velocity in the vertical. Actual observations under a wide range of conditions show that this multiple-point method gives the mean velocity very closely for open-water conditions and that in a completed measurement it seldom varies as much as 1 per cent

¹ Further information regarding the float method is given in Water-Supply Paper 95 and in textbooks on stream flow.

from the value given by the vertical velocity-curve method. It is very extensively used in the regular practice of the United States Geological Survey.

The single-point method consists in holding the meter either at the depth of the thread of mean velocity or at an arbitrary depth for which the coefficient for reducing to mean velocity has been determined or must be assumed.

Extensive experiments by means of vertical velocity curves show that the thread of mean velocity generally occurs between 0.5 and 0.7 total depth. In general practice the thread of mean velocity is considered to be at 0.6 depth, and at this point the meter is held in most of the measurements made by the single-point method. A large number of vertical velocity curve measurements, taken on many streams and under varying conditions, show that the average coefficient for reducing the velocity obtained at 0.6 depth to mean velocity is practically unity. The variation of the coefficient from unity in individual cases is, however, greater than in the 0.2 and 0.8 method and the general results are not as satisfactory.

In the other principal single-point method the meter is held near the surface, usually 1 foot below, or low enough to be out of the effect of the wind or other disturbing influences. This is known as the subsurface method. The coefficient for reducing the velocity taken at the subsurface to the mean has been found to be in general from about 0.85 to 0.95, depending on the stage, velocity, and channel conditions. The higher the stage the larger the coefficient. This method is especially adapted for flood measurements, or for measurements when the velocity is so great that the meter can not be kept in the correct position for the other methods.

The vertical integration method consists in moving the meter at a slow but uniform speed from the surface to the bottom and back again to the surface and noting the number of revolutions and the time taken in the operation. This method has the advantage that the velocity at each point of the vertical is measured twice. It is useful as a check on the point methods. In using the Price meter great care should be taken that the vertical movement of the meter is not rapid enough to vitiate the accuracy of the resulting velocity determination.

In practical work on rough streams, such as exist in Hawaii, the meter should be held at 0.6 depth for depths of 0.8 or less. For greater depths the meter should be held at two points in the vertical, 0.2 and 0.8 from the surface.

When the mean velocities in the different verticals have been found, the average of two adjacent means is taken as the mean velocity for that individual section. The area of the section is

computed by multiplying the width of the section by the mean depth. The discharge of each section is then the product of the area multiplied by the mean velocity, and the total discharge of the stream results from summing up the discharge of the individual sections. In practice the work is tabulated in such a way as to render the computation very simple.¹

Current-meter measurements are not practicable where there are eddies, cross currents, swirls, or passages for the water underneath stones. It is usually possible, however, to improve the channel by removing bowlders and rocks, so that a satisfactory measuring section may be obtained, even on rough, steep streams such as exist in Hawaii.

Three kinds of velocity-area gaging stations are in general use in Hawaii, according to the means provided for making the observations of depth and velocity. They are wading, bridge, and cable stations.

A wading station is one at which measurements are made only by wading—that is, no means exist for getting above the water at any stage except by wading. Such stations are usually on ditches or wide, shallow streams, which do not fluctuate greatly in flow. Frequently, however, measurements are made at low stages by wading, even though other means exist for making measurements at higher stages.

A bridge station is one at which the meter is used from a bridge. In some places highway or other bridges are available from which to make measurements, but generally they are not at the right place on the stream. Special bridges are then built.

A cable station is one at which measurements are made from a cable spanning the stream. Cable stations are used on large streams, such as Hanapepe, Wailua, and Hanalei rivers on the island of Kauai, and Wailuku River on the island of Hawaii. The cable supports the car from which a man works above the water. Distances are marked off on the cable itself or on a small auxiliary cable stretched taut above it.

A suitable place for a gaging station having been selected, a staff gage is set in the edge of the stream, either vertical or inclined, but graduated into tenths, half tenths, or hundredths of feet vertically. The gage is securely fastened to rocks or trees to prevent displacement by floods and is so placed that the zero, or reference datum, is well below extreme low water. The datum is also referred to a permanent bench mark as an additional precaution. An observer is then engaged to record the heights of water, morning and evening; the mean of the two readings being used as the mean gage height for the day.

¹ For a discussion of methods of computing the discharge of a stream see Engineering News, June 25, 1938.

Owing to the rapid rise and fall of most of the streams in Hawaii, two gage-height readings a day will not as a rule give a true mean for the 24 hours. For this reason, and also owing to the fact that many of the gaging stations are necessarily situated in the mountains at points remote from all habitations and difficult of access, the use of automatic recording gages has been found to be generally necessary. The gages used are of various types, some requiring weekly visits and others operating for a month without attention.

The essential features of automatic gages consist of a float free to rise and fall with fluctuations of the water surface, a means of transferring this motion of the float to the record, either directly or through a reducing mechanism, the recording device, and the clock. In most gages used on natural streams the float is connected with a counterweight by means of a chain or perforated tape which passes over a sprocket wheel connected with gearing in such a way as to reduce the motion caused by the rise and fall of the water surface to a convenient scale. This vertical motion from the float may be transferred either to the pencil or other recording device or to the cylinder carrying the paper. The time interval is given by the clock, which may move either the paper or the pencil, according to the float connection. For all autographic records the motions controlled by the float and the clock are brought at right angles so that there results a continuous curve where one set of ordinates represents gage heights, and the other the time interval.

The gage may be designed to accommodate any range of stage. Those used by the United States Geological Survey in Hawaii are designed for variations of 5, 10, 20, 30, and 36 feet, but so far those having a 20-foot range have been found to be sufficient for any stage.

DEFINITION OF TERMS.

The volume of water flowing in a stream—the “run-off” or “discharge”—is expressed in various terms, each of which has become associated more or less definitely with a certain class of work. These terms may be divided into two groups: (1) Those which represent a rate of flow, as “second-foot,” “gallons per minute,” “gallons per 24 hours,” “miner’s inches,” and “run-off in second-foot per square mile,” and (2) those which represent the actual quantity of water, as “run-off in depth in inches,” “million gallons,” and “acre-feet.” They may be defined as follows:

“Second-foot” is an abbreviation for cubic foot per second and is the unit for the rate of discharge of water flowing in a stream 1 square foot in cross section at a rate of 1 foot per second. It is generally adopted as the fundamental unit in the measurement of flowing water and is the “natural” unit, as the foot and the second are the units

used in making the physical determinations. Other units may be computed from this by the use of factors given in the table of equivalents.

“Gallons per minute” is generally used in connection with pumping and city water supply, the United States gallon of 231 cubic inches being the unit of quantity and 1 minute the unit of time.

The “miner’s inch” is the unit for the rate of discharge of water that passes through an orifice 1 inch square under a head which varies locally. It is commonly used by miners and irrigators throughout the West, and is defined by statute in each State in which it is used.

“Second-feet per square mile” is the average number of cubic feet of water flowing per second from each square mile of area drained, on the assumption that the run-off is distributed uniformly both as regards time and area.

“Run-off in inches” is the depth to which the drainage area would be covered if all the water flowing from it in a given period were conserved and uniformly distributed on the surface. It is used for comparing run-off with rainfall, which is usually expressed in depth in inches.

An “acre-foot” is equivalent to 43,560 cubic feet and is the quantity required to cover an acre to the depth of 1 foot. The term is commonly used in connection with storage for irrigation.

In the Territory of Hawaii a unit commonly used in connection with the measurement of water is the “million gallons.” This is used with two meanings—(1) to indicate a rate of flow and (2) to express an actual quantity of water. In the former sense “million gallons per 24 hours” is inferred, 1,000,000 gallons being taken as the unit of quantity, and 24 hours as the unit of time. With this meaning the term is generally used in connection with pumping and irrigation. In the latter sense “million gallons” as an absolute quantity is used in the measurement of storage capacities of reservoirs.

The following convenient approximate relations exist between second-feet, million gallons per 24 hours, and acre-feet: 1 second-foot flowing 24 hours equals about 2 acre-feet; 1,000,000 gallons equals about 3 acre-feet; and 1 second-foot equals approximately two-thirds million gallons per 24 hours.

“Man’s water” is an irrigator’s term also in common use in Hawaii. It signifies the amount of water that one irrigator can properly handle in the field. It varies greatly, being dependent upon the condition of the furrows, the age of the crop, and the skill and individuality of the irrigator. Some measurements indicate that it is about 0.75 second-foot. It may be almost any quantity under 1 second-foot.

CONVENIENT EQUIVALENTS.

The following is a list of convenient equivalents for use in hydraulic computations:

Table for converting discharge in second-feet into run-off in acre-feet.

Discharge (second- feet).	Run-off (acre-feet).				
	1 day.	28 days.	29 days.	30 days.	31 days.
1	1.983	55.54	57.52	59.50	61.49
2	3.967	111.1	115.0	119.0	123.0
3	5.950	166.6	172.6	178.5	184.5
4	7.934	222.1	230.1	238.0	246.0
5	9.917	277.7	287.6	297.5	307.4
6	11.90	333.2	345.1	357.0	368.9
7	13.88	388.8	402.6	416.5	430.4
8	15.87	444.3	460.2	476.0	491.9
9	17.85	499.8	517.7	535.5	553.4

NOTE.—For partial month multiply values for one day by the number of days.

1 second-foot equals 7.48 United States gallons per second; equals 448.8 gallons per minute; equals 646,272 gallons for one day.

1 second-foot for one year covers 1 square mile 1.131 feet or 13.572 inches deep.

1 second-foot for one year equals 31,536,000 cubic feet.

1 second-foot equals about 1 acre-inch per hour.

1 second-foot for one day covers 1 square mile 0.03719 inch deep.

1 second-foot for one day equals 1.983 acre-feet.

1,000,000 United States gallons per day equals 1.55 second-foot.

1,000,000 United States gallons equals 3.07 acre-feet.

1,000,000 cubic feet equals 22.95 acre-feet.

1 acre-foot equals 325,850 gallons.

1 inch deep on 1 square mile equals 2,323,200 cubic feet.

1 inch deep on 1 square mile equals 0.0737 second-foot per year.

1 foot equals 0.3048 meter.

1 mile equals 1.60935 kilometers.

1 mile equals 5,280 feet.

1 acre equals 0.4047 hectare.

1 acre equals 43,560 square feet.

1 acre equals 209 feet square, nearly.

1 square mile equals 2.59 square kilometers.

1 cubic foot equals 0.0283 cubic meter.

1 cubic foot equals 7.48 gallons.

1 cubic foot of water weighs 62.5 pounds.

1 cubic meter per minute equals 0.5886 second-foot.

1 horsepower equals 550 foot-pounds per second.

1 horsepower equals 76.0 kilogram-meters per second.

1 horsepower equals 746 watts.

1 horsepower equals 1 second-foot falling 8.80 feet.

1½ horsepower equals about 1 kilowatt.

To calculate water power quickly: $\frac{\text{Sec.-ft.} \times \text{fall in feet}}{11} = \text{net horsepower on water}$
wheel realizing 80 per cent of theoretical power.

OFFICE METHODS OF COMPUTING AND STUDYING DISCHARGE AND RUN-OFF.

At the end of each year the field or base data for current-meter gaging stations, consisting of daily gage heights, discharge measurements, and notes from observers' books are assembled. The measurements are plotted on cross-section paper and rating curves are drawn wherever feasible. The rating tables prepared from these curves are then applied to the tables of daily gage heights to obtain the daily discharge, and from these applications the tables of monthly discharge and run-off are computed.

Rating curves are drawn and studied with special reference to the class of channels which they represent. The discharge measurements for all classes of stations, when plotted with gage heights in feet as ordinates and discharges in second-feet as abscissas, define rating curves which are generally more or less parabolic in form. For many stations curves of area in square feet and mean velocity in feet per second are also constructed to the same scale of ordinates as the discharge curve. These are used mainly to extend the discharge curves beyond the limits of the plotted discharge measurements, to check the form of the discharge curve, and to determine and eliminate erroneous measurements.

For every rating table the following assumptions are made for the period of application of the table: (a) That the discharge is a function of and increases gradually with the stage; (b) that the discharge is the same whenever the stream is at a given stage, and hence such changes in conditions of flow as may have occurred during the period of application are either compensating or negligible, except that the rating, as stated in the footnote of each table, is not applicable for periods during which the channel was obstructed; (c) that the increased and decreased discharge due to change of slope on rising and falling stages is either negligible or compensating.

As already stated, the gaging stations may be divided into several classes, as indicated in the following paragraphs:

The stations of class 1 represent the most favorable conditions for an accurate rating and are also the most economical to maintain. The bed of the stream is usually composed of rock and is not subject to the deposit of sediment and loose material. This class includes also many stations located in a pool below which is a permanent rocky riffle that controls the flow like a weir. Provided the control is sufficiently high and close to the gage to prevent cut and fill at the gaging point from materially affecting the slope of the water surface, the gage height will for all practical purposes be a true index of the discharge. Discharge measurements made at such stations usually

plot within 2 or 3 per cent of the mean discharge curve, and the rating developed from that curve represents a very high degree of accuracy.

Class 2 comprises mainly stations on rough, mountainous streams with steep slopes. The beds of such streams are, as a rule, comparatively permanent during low and medium stages, and when the flow is sufficiently well defined by an adequate number of discharge measurements before and after each flood the stations of this class give nearly as good results as those of class 1. As it is seldom possible to make measurements covering the time of change at flood stage, the assumption is often made that the curves before and after the flood converged to a common point at the highest gage height recorded during the flood. Hence the only uncertain period occurs during the few days of highest gage heights covering the period of actual change in conditions of flow.

Class 3 includes those stations where the stream bed is of a shifting character, or the controlling section below the gage frequently changes owing to cutting out by the current and the filling in of sand, gravel, and drift. In some cases in Hawaii changes are caused by the growth of vegetation in the stream bed. No absolute rule can be laid down for stations of this class. Each rating curve must be constructed mainly on the basis of the measurements of the current year, the engineer being guided largely by the history of the station and the following general law: If all measurements ever made at a station of this class are plotted on cross-section paper, they will define a mean curve which may be called a standard curve. It has been found in practice that if after a change caused by high stage a relatively constant condition of flow occurs at medium and low stages, all measurements made after the change will plot on a smooth curve which is practically parallel to the standard curve with respect to ordinates or gage heights. This law of the parallelism of rating curves is the fundamental basis of all ratings and estimates at stations with semipermanent and shifting channels. It is not absolutely correct, but, with few exceptions, answers all the practical requirements of estimates made at low and medium stages after a change at a high stage. This law appears to hold equally true whether the change occurs at the measuring section or at some controlling point below. The change is, of course, fundamentally due to change in the channel caused by cut or fill, or both, at or near the measuring section. For all except small streams the changes in section usually occur at the bottom. The following simple but typical examples illustrate this law:

(a) If 0.5 foot of planking were to be nailed on the bottom of a well-rated wooden flume of rectangular section, there would result, other conditions of flow being equal, new curves of discharge, area, and

velocity, each plotting 0.5 foot above the original curves when referred to the original gage. In other words, this condition would be analogous to a uniform fill or cut in a river channel which either reduces or increases all three values of discharge, area, and velocity for any gage height. In practice, however, such ideal conditions rarely exist.

(b) In the case of a cut or fill at the measuring section, there is a marked tendency toward decrease or increase, respectively, of the velocity. In other words, the velocity has a compensating effect, and if the compensation is exact at all stages the discharge at a given stage will be the same under both the new and the old conditions.

(c) In the case of uniform change along the crest of a weir or rocky control, the area curve will remain the same as before the change, and it can be shown that here again the change in velocity curve is such that it will produce a new discharge curve essentially parallel to the original discharge curve with respect to their ordinates.

Of course, in actual practice such simple changes of section do not occur. The changes are complicated and lack uniformity, a cut at one place being largely offset by a fill at another, and vice versa. If these changes are very radical and involve large percentages of the total area—as, for example, on small streams—there may result a wide departure from the law of parallelism of rating curves. In complicated changes of section the corresponding changes in velocity which tend to produce a new parallel discharge curve may interfere with each other materially, causing eddies, boils, backwater, and radical changes in slope. In such extreme conditions, however, the measuring section would more properly fall under class 4 and would require very frequent measurements of discharge. Special stress is laid on the fact that in the lack of other data to the contrary the utilization of this law will yield the most probable results.

Slight changes at low or medium stages of an oscillating character are usually averaged by a mean curve drawn among them parallel to the standard curve, and if the individual measurements do not vary more than 5 per cent from the rating curve the results are considered good for stations of this class.

Class 4 comprises stations on streams that have soft, muddy, or sandy beds. Good results can be obtained from such sections only by frequent discharge measurements, the frequency ranging from a measurement every two or three weeks to a measurement every day, according to the rate of diurnal change in conditions of flow. These measurements are plotted and a mean or standard curve drawn among them. It is assumed that there is a different rating curve for every day of the year and that this rating is parallel to the standard curve with respect to their ordinates. On the day of a measurement the rating curve for that day passes through that measurement.

For days between successive measurements it is assumed that the rate of change is uniform, and hence the ratings for the intervening days are equally spaced between the ratings passing through the two measurements. This method must be modified or abandoned altogether under special conditions. Personal judgment and a knowledge of the conditions involved can alone dictate the course to pursue in such cases.

The computations have as a rule been carried to three significant figures. Computation machines and the 20-inch slide rule have been generally used. All computations are carefully checked.

After the computations have been completed they are entered in tables and carefully studied and intercompared to eliminate or account for all gross errors so far as possible. Missing periods are filled in, so far as feasible, by means of comparison with records for adjacent streams. The attempt is made to complete years or periods of discharge, thus eliminating fragmentary and disjointed records. Full notes accompanying such estimates follow the daily and monthly discharge tables.

EXPLANATION OF TABLES.

For each regular current-meter gaging station are given in general the following data: Description of station, list of discharge measurements, table of daily gage height, table of daily discharge, table of monthly and yearly discharge, and run-off in acre-feet. For stations located at weirs or dams the gage-height table is omitted.

All rates of flow are expressed as second-feet, because distances and depths are measured in feet, and velocities in feet per second. The flow is thus obtained in cubic feet per second, or more briefly in "second-feet." The term "million gallons per 24 hours" is not used except in a few tables where data have been furnished in these units by private corporations. "Million gallons per 24 hours" is not a primary but a derived unit. To convert second-feet into million gallons per 24 hours multiply by 0.646.

In addition to statements regarding the location and installation of current-meter stations, the descriptions give information in regard to any conditions which may affect the constancy of the relation of gage height to discharge, covering such points as shifting channels and backwater; also information regarding diversions which decrease the total flow at the measuring section. Statements are also made regarding the accuracy and reliability of the data.

The discharge-measurement table gives the results of the discharge measurements made during the year, including the date, name of hydrographer, gage height, and discharge in second-feet.

The table of daily gage height records the daily fluctuations of the surface of the river as found from the mean of the gage readings taken

each day. At most stations the gage is read in the morning and in the evening unless a continuous record is obtained by means of an automatic instrument. The gage height given in the table represents the elevation of the surface of the water above the zero of the gage. All gage heights affected by shifting conditions of flow or by backwater from obstructions are published as recorded, with suitable footnotes. The rating table is not applicable for such periods unless the proper corrections to the gage heights are known and applied. Attention is called to the fact that the zero of the gage is placed at an arbitrary datum and has no relation to zero flow or the bottom of the river. In general the zero is located somewhat below the lowest known flow, so that negative readings shall not occur.

The discharge measurements and gage heights are the base data from which rating tables, daily discharge tables, and monthly discharge tables are computed.

The rating table gives, either directly or by interpolation, the discharge in second-feet corresponding to every stage of the river recorded during the period for which it is applicable. It is not published in this report, but can be determined from the daily gage heights and daily discharges, for the purpose of verifying the published results as follows:

First plot the discharge measurements on cross-section paper with gage height in feet as ordinates and discharge in second-feet as abscissas. Then tabulate a number of gage heights taken from the daily gage-height table for the complete range of stage given and the corresponding discharges for the days selected from the daily discharge table and plot the values on cross-section paper. The last points plotted will define the rating curve used and will lie among the plotted discharge measurements. After drawing the rating curve, a table can be prepared by scaling off the discharge in second-feet for each tenth foot of gage height. These values should be so adjusted that the first differences shall always be increasing or constant, except for known conditions of backwater.

The table of daily discharge gives the discharge in second-feet corresponding to the observed gage height as determined from the rating table, the number of significant figures used varying with the size of the discharge. For quantities below 0.5 second-foot the daily discharge is carried to hundredths; from 0.5 to 9.9 second-feet, to tenths only; from 10 to 99 second-feet all decimals are omitted, and above 100 second-feet only three significant figures are used.

In the table of monthly discharge the column headed "Maximum" gives the mean flow, as determined from the rating table, for the day when the mean gage height was highest. As the gage height is the mean for the day, it does not indicate correctly the stage when the water surface was at crest height, and the corresponding discharge

was consequently larger than given in the maximum column. Likewise in the column of "Minimum" the quantity given is the mean flow for the day when the mean gage height was lowest. The column headed "Mean" is the average flow in cubic feet for each second during the month. On this the computations for the remaining columns, which are defined on page 17, are based.

ACCURACY AND RELIABILITY OF FIELD DATA AND COMPARATIVE RESULTS.

Practically all discharge measurements made under fair conditions are well within 5 per cent of the true discharge at the time of observation. Inasmuch as the errors of meter measurements are largely compensating, the mean rating curve, when well defined, is much more accurate than the individual measurements. Numerous tests and experiments have been made to test the accuracy of current-meter work. These show that it compares very favorably with the results from standard weirs, and, owing to simplicity of methods, usually gives results that are much more reliable than those from the ordinary weir used under conditions widely different from those under which the weir formula was derived.

The work is, of course, dependent on the reliability of the observers. With relatively few exceptions, the observers perform their work honestly. Care is taken, however, to watch them closely and to inquire into any discrepancies. It is, of course, obvious that one gage reading a day does not always give the mean height for that day. As an almost invariable rule, however, errors from this source are compensating and virtually negligible in a period of one month, although a single day's reading may, when taken by itself, be considerably in error.

In order to give engineers and others information regarding the probable accuracy of the computed results, footnotes are added to the daily discharge tables, stating the probable accuracy of the rating tables used, and an accuracy column is inserted in the monthly discharge table. For the rating tables "well defined" indicates in general that the rating is probably accurate within 5 per cent; "fairly well defined," within 10 per cent; "poorly defined" or "approximate," within 15 to 25 per cent. These notes are very general and are based on the plotting of the individual measurements with reference to the mean rating curve.

DIVISION OF WORK.

On account of the isolation of the different islands of the Territory an engineer or employee was assigned to take charge of the field work on each one of the four larger islands with temporary headquarters on that island.

Persons in charge of field work.

Island.	In charge.	Temporary headquarters.
Oahu.....	W. F. Martin, district engineer (Jan. 1 to Mar. 27).... C. H. Pierce, acting district engineer (Mar. 28 to Aug. 13). G. K. Larrison, district engineer (Aug. 14 to Dec. 31).	Honolulu (permanent).
Kauai.....	W. V. Hardy, field assistant.....	Waimea.
Maui.....	J. B. Stewart, clerk acting field assistant (Jan. 1 to Nov. 30). C. T. Bailey, assistant engineer (Dec. 1-31).....	Wailuku.
Hawaii.....	C. H. Pierce, assistant engineer (Jan. 1 to Mar. 27).... E. O. Christiansen, assistant engineer (July 10 to Dec. 31).	Hilo.

Office Engineer J. C. Dort, junior engineer, at Honolulu, October 29 to December 31, assisted on Oahu field work.

Ratings, applications, computations, etc., were made by G. K. Larrison, J. C. Dort, E. O. Christiansen, C. T. Bailey, W. V. Hardy, E. E. Goo, G. R. White, S. W. Dort, R. M. S. Goo, H. L. Book, H. H. Kennedy, H. M. Kennedy, and E. J. Howard. The report was edited by Mrs. B. D. Wood.

GAGING STATIONS MAINTAINED IN HAWAII.

The following list comprises the gaging stations maintained in Hawaii by the United States Geological Survey and cooperative parties. The stations are arranged by stream basins and appear in systematic order for the several islands, tributaries of main streams being indicated by indention. The date refers to the years or parts of years for which records are available. A dash following the date indicates that the station was being maintained December 31, 1912.

KAUAI ISLAND.

Waimea River near Waimea, 1910-

Poomau River:

Kawaikoi Stream near Waimea, 1909-

Waiakoali Stream near Waimea, 1909-

Mohihi Stream near Waimea, 1909-

Waialae Stream near Waimea, 1910-

Kekaha ditch at camp No. 1, near Waimea, 1910-

Kekaha ditch at flume No. 2, near Waimea, 1910-

Kekaha ditch at siphon, near Waimea, 1910-

Kekaha ditch at tunnel No. 12 weir, near Waimea, 1910-

Waimea ditch near Waimea, 1911-

Kamenehune ditch near Waimea, 1911-

Makaweli River near Waimea, 1911-

Mokuone River:

Halekua Stream near Waimea, 1912-

Olokele River:

Olokele ditch at tunnel No. 12, near Makaweli, 1910-

Olokele ditch near Waimea, 1912-

Poowaiomahaihai ditch near Waimea, 1911-

- Hanapepe River at Hanapepe Falls, near Eleele, 1911-
 Hanapepe River at Kaula, near Eleele, 1910-
 Hanapepe ditch at Hanapepe Falls, near Eleele, 1911-
 Hanapepe ditch at Koula, near Eleele, 1910-
 Hanapepe ditch at weir, near Hanapepe, 1910-

- Lowrie ditch at Opana weir, near Huelo, 1910-
- Haiku ditch at Peahi weir, near Huelo, 1910-

HAWAII ISLAND.**Hilo group:**

- Wailuku River near Hilo, 1911-
- Honolii River at Kaiwiki, near Hilo, 1911-
- Honolii ditch at Kaiwiki, near Hilo, 1911.
- Kawainui River at Kawainui, near Pepeekeo, 1911-
- 4 stations at Piihonua, near Hilo, 1912.
- 81 stations at 2,700 feet level, in forest back of Hilo, 1911-

Hamakua group:

- Kawainui Branch of Waipio River, near Waipio, 1911-
- Waipio River below Koiawe Stream, near Waipio, 1911-
- Waipio River below Waima Stream, near Waipio, 1911-
- Waipio River at 360 feet elevation, near Waipio, 1901-2.
- New Hamakua ditch at Waima Stream, near Waipio, 1912-
- New Hamakua ditch at main weir near Kukiuhaele, 1911-
- Kawainui Stream at 2,120 feet elevation, near Waipio, 1901-2.
- Kawainui Stream at 1,435 feet elevation, near Waipio, 1901-2.
- Kawainui Stream at 775 feet elevation, near Waipio, 1901-2.
- Branch No. 3 of Kawainui Stream at 1,700 feet elevation, near Waipio, 1901-2.
- Branch No. 2 of Kawainui Stream at 1,405 feet elevation, near Waipio, 1901-2.
- Branch No. 1 of Kawainui Stream at 1,380 feet elevation, near Waipio, 1901-2.
- Alakahi Stream at 1,200 feet elevation, near Waipio, 1901-2.
- Alakahi Stream at 730 feet elevation, near Waipio, 1901-2.
- Koiawe Stream at 1,120 feet elevation, near Waipio, 1901-2.
- Koiawe Stream at 610 feet elevation, near Waipio, 1901-2.
- Waima Stream at 790 feet elevation, near Waipio, 1901-2.
- Waima Stream at 385 feet elevation, near Waipio, 1901-2.

Kohala group:

- Honokane Stream:
 - East Branch of Honokane Stream at 1,300 feet elevation, near Honokane, 1901.
 - East Branch of Honokane Stream at 770 feet elevation, near Honokane, 1901.
 - West Branch of Honokane Stream at 1,370 feet elevation, near Honokane, 1901.
 - West Branch of Honokane Stream at 775 feet elevation, near Honokane, 1901.
 - Kohala ditch near Kohala, 1907-

GEOGRAPHY OF THE HAWAIIAN ISLANDS.¹

The Hawaiian Islands are situated in the north Pacific Ocean due west of the central part of Mexico and about 2,100 miles southwest of San Francisco, from which Honolulu may be reached in about 6 days. Dutton² has described the group as consisting of 12 islands—

¹ Adapted from Dutton, C. E., Hawaiian volcanoes: U. S. Geol. Survey Fourth Ann. Rept., pp. 81-212, 1884.

² Op. cit., p. 81.

eight inhabited and four mere barren rocks—lying between meridians 154° 30' and 160° 30' west of Greenwich and between parallels 18° 40' and 22° 15' north; but northwest of this principal part of the group are a dozen smaller low islands and reefs which are shown on the charts and over which the Territorial government has authority. The westernmost of these, which are known as the Ocean Islands, lie about in longitude 178° 30' west—very nearly the antipodes of Greenwich—and 29° north. The archipelago, therefore, extends over nearly 25° of longitude, or about 1,800 miles,¹ its form being rudely crescentic and its general trend northwest-southeast. Hitchcock¹ gives the following list of the islands in order from west to east with areas and extreme altitudes.

Islands of the Hawaiian Archipelago.

Low islands and reefs. ²	Altitude (feet).
Ocean Islands.....	10
Midway Islands.....	57
Gambia Shoal.	
Pearl and Hermes reefs.	
Lisiansky Island.....	50
Laysan Island.....	25
Maro Reef.	
Dowsett's Reef.	
The lowest of the high islands.	
Gardiner Island.....	170
French Frigate Shoal.....	120
Necker Island.....	300
Frost Shoal.	
Nihoa or Bird Island.....	903
High inhabited islands, with area and highest point.	
Niihau (97 square miles).....	1, 300
Cinder cones adjoining, named Kaula and Lehua.	
Kauai (547 square miles; highest point, Waialeale).....	³ 5, 170
Oahu (598 square miles; highest point, Kaala).....	4, 030
Molokai (261 square miles; highest point, Komokoa).....	4, 958
Lanai (139 square miles).....	3, 400
Maui (728 square miles; highest point, Haleakala).....	³ 10, 350
Kahoolawe (69 square miles; highest point, Moaulu Hill).....	1, 472
Hawaii (4,015 square miles; highest point, Mauna Kea).....	13, 825

Of these, Hawaii, Maui, Oahu, Kauai, and Molokai are by far the most important in area and in number of inhabitants.

All these islands are volcanic. No rocks other than volcanic are found on any of them except a few remnants of raised sea beaches

¹ Hitchcock, C. H., Hawaii and its volcanoes, p. 1, Honolulu, 1909.

² May be swept by storm waves.

³ Hitchcock's figures, 5,250 and 10,032, revised from more recent maps.

composed of consolidated coral sands. All the larger ones are very mountainous and lofty. The culminating points of the island of Hawaii are Mauna Kea, 13,825 feet, and Mauna Loa, 13,675 feet above sea level. The summit of Haleakala, on East Maui, is 10,350 feet, and the mountains of West Maui attain 5,900 feet. Oahu has a peak on the eastern side of the island 3,100 feet high, and another on the western side 4,030 feet high. The loftiest point of Kauai is about 5,170 feet above the sea. Deep-sea soundings in the vicinity have disclosed the fact that these volcanic piles are only the summits of gigantic mountain masses rising abruptly from the bottom of the Pacific, which for many hundreds of miles around them is only moderately diversified. The slopes of Mauna Loa east, west, and south descend beneath the surface of the ocean with a gradient fully equal to if not greater than the visible slope of its flanks. The submarine slopes of all the other islands in directions perpendicular to the principal axis of the group are equally great and possibly somewhat greater. The depths attained by these continuous slopes within 30 to 50 miles of the shores vary from 2,400 to 3,100 fathoms, or 14,000 to 19,000 feet. Mauna Loa and Mauna Kea, referred to their true bases at the bottom of the Pacific, are therefore mountains not far from 30,000 feet in height. In general the island group consists of the summits of a gigantic submarine mountain chain, projecting its loftier peaks and domes above the water.

On the island of Hawaii the volcanic forces are still in operation. On the eastern portion of Maui they have rested at a very recent epoch. In the other islands they have long been extinct, and the piles they built up have been greatly ravaged by erosion. On Hawaii the large volcano Hualalai, just west of Mauna Loa, gave forth three eruptions in the early part of the present century, but has been dormant since 1811. Mauna Kea gives evidence of having reposed for many centuries—or throughout a period that, historically considered, may have lasted some thousands of years; though, if we value time by the geologic scale, the date of its last activity would be regarded as very recent. Haleakala, on Maui, gives indications of considerably greater recency in its last eruptions than Mauna Kea, but the natives have no traditions of any outbreak from it, and we may infer that it has been quiet for several hundred years. With regard to the other volcanic centers, we have no means of judging the antiquity of their final action except the progress made by erosion in demolishing them, and this progress is, in every instance, considerable. It is most conspicuous on Kauai and Oahu, and almost equally so on Molokai and West Maui. From this it is inferred that the western islands of the group have longest enjoyed immunity from eruption. Kauai, especially, is frequently spoken of

as the oldest island of the group, and, judging from the amount of destruction wrought upon it by the eroding forces, the statement is in some measure apparently justified, but only to this extent, the period which has elapsed since the cessation of eruption has probably been longer there than in the other islands. It does not follow, however, that the eruptions began there any earlier than on Hawaii.

The one continuously active volcanic vent of the islands is Kilauea, far down on the eastern flank of Mauna Loa—"the great mountain." No other volcano in the world approaches Mauna Loa in the vastness of its mass or in the magnitude of its eruptive activity. There are many volcanic peaks higher in the air, but most of them are planted upon elevated platforms, where they appear as mere cones of greater or less size. We do not know at what level the base of Mauna Loa is situated. We only know that it is below sea level, and probably far below it. But on the other hand, it may not be so low as the adjoining depths of the Pacific.

Mauna Kea—"the white mountain"—is also a colossus among volcanoes. The summit of Mauna Kea is a trifle higher than that of Mauna Loa, but its slopes are steeper and its base is therefore much smaller. The magnitude of Mauna Loa is due chiefly to the great area of its base, which is nearly elliptical in shape, with a major diameter of 74 miles and a minor of 53 miles, measured at sea level.

In the aggregate of its eruptions Mauna Loa is also unrivalled. Some of the volcanoes of Iceland have been known to disgorge at a single outbreak masses of lava fully equal to them. But in that island such intravasations are infrequent, and a century has elapsed since any of such magnitude have been emitted, though several of minor extent have been outpoured. The eruptions of Mauna Loa are all of great volume, and occur irregularly, with an average interval of about eight years. Taking the total quantity of material disgorged during the past century, no other volcano is at all comparable to it.

Mauna Loa and Kilauea are in many important respects abnormal volcanoes. Most notable is the singularly quiet character of their eruptions. Rarely are these portentous events attended by any of that extremely explosive action which is characteristic of nearly all other volcanoes. Only once or twice within the historic period have they been accompanied by earthquakes or subterranean rumblings. The vast jets of steam blown miles high, hurling stones, cinders, and lapilli far and wide, filling the heavens with vapor and smoke, and hailing down ashes and fragments over the surrounding regions, have never been observed here. Some action of this sort is indeed represented, but only in a feeble way. The lava wells forth like water from a hot, bubbling spring, but so mild are the explosive forces that

the observer may stand to the windward of the grandest eruption, and so near the source that the heat will make the face tingle, yet without danger. Ordinarily the outbreak takes place without warning and without the knowledge of the inhabitants, who first become aware of it at nightfall, when the sky is aglow and the fiery fountains are seen playing. As the news spreads, hundreds of people flock to it to witness the sublime spectacle and display almost as much eagerness to approach the scene of an eruption as the people of other countries show to get away from one.

The great magnitude of the individual eruptions of Mauna Loa and Kilauea, and the absence of fragmental products, supply an explanation of their abnormally flat profiles. Fragmental ejecta pile up around the vents from which they are projected; but great streams of fluent lava run far away from their sources. The large pits or so-called craters which are sunken in the summits Kilauea and Mauna Loa, and the still more remarkable one on Haleakala, are not entirely unparalleled, though their analogues in other regions are very uncommon.

In all those portions of the islands where quiet has long prevailed the scenery has habitudes of extreme boldness and animation. Cliffs, crags, and canyons are carved in the mountains with as much sharpness and spirited detail as in the plateau country of North America. In West Maui and Kauai may be found walled valleys and amphitheaters which almost rival Yosemite. The windward fronts of Oahu and Molokai stand 3,000 to 4,000 feet high, and are carved in a manner which is rarely surpassed by the finest sculpture in the valley of the Colorado. On the weather sides of Hawaii and Maui the gentle slopes of the mountains terminate on the ocean in walls a few hundred feet high, and the platforms are gashed with canyon valleys that are marvels of beauty.

The climate of the islands presents considerations of very great interest. It is difficult to find anywhere any greater constancy of atmospheric conditions than those prevailing over the ocean within the heart of the trade-wind belt. The temperature varies but little from winter to summer, and the general drift of the atmosphere is rarely interfered with by storms and cyclones. And yet upon the islands themselves it may be said that there are almost as many climates as there are square leagues. And the differences of climatal condition exhibited by localities separated only half a dozen miles are extreme. As a general rule the windward sides are excessively rainy, the precipitation may exceed 400 inches in a year. The leeward sides are generally arid, but to this there are some striking exceptions, especially under the lee of Mauna Loa, where the rainfall is almost as great as on the weather side.

STATION RECORDS.

ISLAND OF KAUAI.

WAIMEA RIVER BASIN.

WAIMEA RIVER NEAR WAIMEA, KAUAI.

Location.—About 2 miles north of Waimea and 250 feet above ford.

Records available.—July 9, 1910, to December 31, 1912.

Gage.—Vertical and inclined staff read once daily; datum unchanged.

Channel.—Bottom covered with sand and bowlders; seems fairly permanent.

Discharge measurements.—Made from a wire suspension bridge.

Accuracy.—Records fair.

Discharge measurements of Waimea River near Waimea, Kauai, in 1912.

KAWAIKOI STREAM NEAR WAIMEA, KAUAI.

Location.—About 8 miles northeast of Knudsen's mountain house; reached from Waimea by horse trail.

Records available.—April 3, 1909, to December 31, 1912.

Gage.—A 34-day Barrett & Lawrence clock register; datum unchanged.

Channel.—Practically permanent.

Discharge measurements.—Made from a wire suspension bridge.

Accuracy.—Records good.

Discharge measurements of Kawaikoi Stream near Waimea, Kauai, in 1912.

WAIKOALI STREAM NEAR WAIMEA, KAUAI.

Location.—About 10 miles northeast of Knudsen's mountain house; reached from Waimea.

Records available.—April 13, 1909, to December 31, 1912.

Gage.—Vertical staff read at irregular times; datum unchanged.

Channel.—Permanent.

Discharge measurements.—Made from footbridge 75 feet below trail crossing; low-water measurements made by wading 50 feet above gage.

NOTE.—Miscellaneous gage readings.

MOHIHI STREAM NEAR WAIMEA, KAUAI.

Location.—About 12 miles northeast of Knudsen's mountain house; reached by saddle horse from Waimea 1½ days' travel.

Records available.—April 13, 1909, to December 31, 1913.

Drainage area.—2.20 square miles.

Gage.—A vertical staff; datum unchanged.

Channel.—One at gage, two at low-water measurement section; practically permanent.

Discharge measurements.—Made from suspension bridge.

Discharge measurements of Mohihi Stream near Waimea, Kauai, in 1912.

Date.	Hydrographer.	Gage height.	Dis-charge.
July 2	W. V. Hardy.....	<i>Feet.</i> 3.68	<i>Sec.-ft.</i> 1.49
Aug. 6do.....	3.64	1.12
Oct. 5do.....	3.61	.71

The following gage readings were made: January 28, gage height, 4.0; April 2, gage height, 4.10; December 3, gage height, 7.10.

WAIALAE STREAM NEAR WAIMEA, KAUAI.

Location.—About 3 miles by trail northeast of F. Gay's mountain house; reached by saddle horse from Waimea in about one day's ride.

Records available.—August 1, 1910, to December 31, 1912.

Gage.—Barrett & Lawrence hydro-chronograph.

Channel.—Practically permanent.

Discharge measurements.—Made from a cable and car.

Accuracy.—Records good.

Discharge measurements of Waialae Stream near Waimea, Kauai, in 1912.

KEKAHA DITCH AT CAMP NO. 1,¹ NEAR WAIMEA, KAUAI.

Location.—About 8 miles north of Waimea at camp No. 1 and a short distance below the diversion dam.

Records available.—January 1, 1910, to December 31, 1912.

Gage.—Vertical staff; read once a day; datum unchanged.

Discharge measurements.—Made with an 8-foot sharp-crested weir.

Cooperation.—Gage heights furnished by the Kekaha Sugar Co.

¹ Described in Water-Supply Paper 318 as Kekaha ditch at intake near Waimea.

The following discharge measurement was made by W. V. Hardy at the United States Geological Survey gage, about 200 feet above the Kekaha Sugar Co.'s weir: March 8, 1912: Gage height, 3.64 feet; discharge, 85.3 second-feet.

Daily discharge, in second-feet, of Kekaha ditch at camp No. 1, near Waimea, Kauai, for 1912.

^a Ditch was dry Apr. 5-13; mean for the month is mean of 21 days.

^b Mean for the year is mean of 357 days.

KEKAHA DITCH AT FLUME NO. 2,¹ NEAR WAIMEA, KAUAI.

Location.—About 6 miles north of Waimea and 2 miles below intake.

Records available.—December 1, 1910, to December 31, 1912.

Gage.—Vertical staff; read twice daily, at 7 a. m. and 5 p. m.; datum unchanged.

Channel.—Probably permanent.

Discharge measurements.—Made from tie beam 2 feet above gage.

Cooperation.—Station maintained in cooperation with Kekaha Sugar Co.

The following discharge measurement was made by W. V. Hardy:

March 8, 1912: Gage height, 2.80 feet; discharge, 84.6 second-feet.

Daily gage height, in feet, of Kekaha ditch at flume No. 2, near Waimea, Kauai, for 1912.

^a Ditch dry Apr. 5 to 13.

KEKAHA DITCH AT SIPHON NEAR WAIMEA, KAUAI.

Location.—About 4 miles north of Waimea, 50 feet above upper end of siphon where ditch crosses Waimea River.

Records available.—December 1, 1910, to December 31, 1912.

Gage.—Vertical staff; read twice daily, at 7 a. m. and 5 p. m.; datum unchanged.

Channel.—Probably permanent.

Discharge measurements.—Made from a temporary foot bridge.

Cooperation.—Station maintained in cooperation with Kekaha Sugar Co.

The following discharge measurement was made by W. V. Hardy:

March 8, 1912: Gage height, 4.43 feet; discharge, 74.4 second-feet.

¹ Described in Water Supply Paper 318, p C2, as "Kekaha ditch at flume No. 3."

Daily gage height, in feet, of Kekaha ditch at siphon near Waimea, Kauai, for 1912.

[Mannel Arruda, observer.]

^a Ditch dry Apr. 5-13. Mean for the month is the mean of 21 days.

^b Mean for the year is the mean of 357 days.

WAIMEA DITCH NEAR WAIMEA, KAUAI.

Location.—About 4 miles north of Waimea and 300 feet below intake.

Records available.—November 4, 1911, to December 31, 1912.

Gage.—Vertical staff; read once each day, at 7 a. m.; datum unchanged.

Channel.—Fairly permanent.

Discharge measurements.—Made from a pole bridge 8 feet long, and graduated in 1-foot sections from 0 to 5.7 feet.

Diversions.—A lateral diverts water from the left bank of the ditch about 25 feet below the gage.

Accuracy.—Record fair.

KAMENEHUNE DITCH NEAR WAIMEA, KAUI.

Location.—About 3 miles above Waimea and 200 feet below wire suspension bridge across Waimea River; reached by wagon road up the right side of Waimea River.

Records available.—October 9, 1911, to December 31, 1912.

Gage.—Vertical staff; read once daily, at irregular hours; datum unchanged.

Channel.—Probably shifting.

Discharge measurements.—Made from plank across ditch.

Accuracy.—Data insufficient for estimate of discharge.

Discharge measurements of Kamenehune ditch near Waimea, Kauai, in 1912.

[Hydrographer, W. V. Hardy.]

HALEKUA STREAM NEAR WAIMEA, KAUAI.

Location.—About 12 miles northeast of Waimea; station reached by saddle horse over trail from Waimea via Gay's mountain house; two days required for round trip; a guide is necessary.

Records available.—October 11, 1912, to December 31, 1912.

Gage.—Barrett & Lawrence automatic register.

Channel.—Practically permanent.

Discharge measurements.—Measurements are made by wading.

Cooperation.—Station maintained in cooperation with Hawaiian Sugar Co.

Discharge measurements of Halekua Stream near Waimea, Kauai, in 1912.

Date.	Hydrographer.	Gage height.	Dis-charge.
Oct. 12	W. V. Hardy.....	<i>Feet.</i> 3.52	<i>Sec.-ft.</i> 0.48
Nov. 18do.....	3.60	1.50

OLOKELE DITCH AT TUNNEL NO. 12, NEAR MAKAWELI, KAUAI.

Location.—About 12 miles northeast of Waimea; about 9 miles, straight-line measurement, northeast of Makaweli; and about 2 miles below intake.

Records available.—January 1, 1910, to December 31, 1912.

Gage.—A vertical staff gage; datum unchanged.

Channel.—Permanent.

Discharge measurements.—Made from a plank which is thrown across ditch when measurement is taken.

Accuracy.—Very good.

Cooperation.—Gage is the property of the Hawaiian Sugar Co., which furnishes gage heights at the end of the year.

Discharge measurements of Olokele ditch at tunnel No. 12, near Makaweli, Kauai, in 1912.

Date.	Hydrographer.	Gage height.	Dis-charge.

POOWAIOMAHAIHAI DITCH NEAR WAIMEA, KAUAI.

Location.—About 2 miles northeast of Waimea, 250 feet below intake and 110 feet below bridge station on Makaweli River.

Records available.—October 27, 1911, to December 31, 1912.

Gage.—A vertical staff gage spiked to tree on left bank of ditch; read at noon each day.

Channel.—Permanent.

Discharge measurements.—Made from timber bridge 15 feet above gage.

Accuracy.—Good.

Discharge measurements of Poowaiomahaihai ditch near Waimea, Kauai, in 1912.

[Hydrographer, W. V. Hardy.]

HANAPEPE DITCH AT WEIR NEAR HANAPEPE,¹ KAULAI

Location.—About 2½ miles northeast of Hanapepe, below the last siphon crossing Hanapepe River.

Records available.—January, 1910, to December 31, 1912.

Gage.—Staff gage spiked to right bank of ditch; read once daily; zero on gage equals crest of weir.

Channel.—Permanent.

¹ Described in Water-Supply Paper 318, p. 85, as near Makaweli.

Discharge measurements.—Measured by a 12-foot sharp-crested weir with end contraction and from a plank across ditch.

Accuracy.—Records good.

Cooperation.—Station is the property of the Hawaiian Sugar Co. and records are furnished at end of calendar year.

Daily discharge, in second-feet, of Hanapepe ditch at weir near Hanapepe, Kauai, for 1912.

NOTE.—Gage heights show days when water was flowing over dam. Station not visited Sundays, but lack of gage heights on week days indicates that all the water was diverted at the dam.

HILOA DITCH AT HANAPEPE FALLS, NEAR ELEELE, KAUAI.

Location.—About 8 miles north of Eleele and 335 feet below intake.

Records available.—November 22, 1911, to December 31, 1912.

Gage.—Vertical staff; read at irregular hour once each day except Sundays; datum unchanged.

Channel.—Permanent.

Discharge measurements.—Made from plank across ditch at gage.

¹ Described in Water-Supply Paper 318, p. 86, as "Hiloa Stream at Hanapepe Falls, near Eleele, Kauai."

KAPAA RIVER BASIN.

KAPAA RIVER AT KAPAHI, NEAR KAPAA, KAUAI.

Location.—About one-half mile above the intake of the Kapaa ditch, 5 miles north-west of Kapaa, and 4 miles west of Kealia.

Records available.—July 23, 1910, to December 31, 1912.

Gage.—Vertical staff gage spiked to left bank of stream; read twice daily, about 7 a. m. and 2 p. m.; datum unchanged.

Channel.—Fairly permanent.

Discharge measurements.—Made from a wire suspension bridge.

Accuracy.—Records good.

Cooperation.—Station maintained in cooperation with the Makee Sugar Co.

The following discharge measurement was made by W. V. Hardy:

February 16, 1912: Gage height, 1.42 feet; discharge, 11.8 second-feet.

Daily gage height, in feet, of Kapaa River at Kapahi, near Kapaa, Kauai, for 1912.

[S. Okimoto, observer.]

KAPAHĪ DITCH AT KAPAHĪ, NEAR KAPAA, KAUAL.

Location.—About 4 miles west of Kealia and 600 feet below the diversion dam in Kapaa River.

Records available.—April 15, 1909, to December 31, 1912.

Gage.—Watson clock register; datum unchanged.

Discharge measurements.—There is a 20-foot sharp-crested weir immediately below the gage, but meter measurements give a different rating from the weir formula.

Accuracy.—Records good.

Cooperation.—Station maintained in cooperation with the Makee Sugar Co.

The following discharge measurement was made by W. V. Hardy:

February 16, 1912: Gage height, 0.31 foot; discharge, 10.6 second-feet.

Daily gage height, in feet, of Kapahī ditch at Kapahī, near Kapaa, Kauai, for 1912.

[K. Okimoto, observer.]

NOTE.—The five discharge measurements made in 1911 and 1912 give a very well-defined curve that has a different slope from the curve of weir formula $Q=3.33 LH^{3/2}$ when $L=20$ feet. Daily discharge for 1912 determined from curve derived from meter measurements. Discharge interpolated for days for which gage heights are missing, Jan. 20 to 27 and Feb. 2 to 6.

Monthly discharge of Kapahi ditch at Kapahi, near Kapaa, Kauai, for 1912.

Month.	Discharge in second-feet.			Run-off (total in acre-feet).	Accu- racy.

The period.....	11,900

NOTE.—No record obtained June 16-29, Aug. 26-29, and Oct. 17-19. Mean for June is mean of 16 days. Mean for August is mean of 27 days. Mean for October is mean of 27 days.

KANEHA DITCH AT WEIR NEAR KEALIA, KAUAI.

Location.—About 5 miles northwest of Kealia, a short distance below the outlet from the Kaneha reservoir.

Records available.—January 1, 1909, to December 31, 1912.

Gage.—Staff gage; read once a day; datum unchanged; record from Watson clock register established in 1910 believed unreliable.

Discharge measurements.—Made with 20-foot sharp-crested weir.

Accuracy.—Fair.

Cooperation.—Estimates of daily discharge in million gallons furnished by Makee Sugar Co.

Daily discharge, in million gallons, of Kaneha ditch at weir near Kealia, Kauai, for 1912.

ANAHOLA RIVER BASIN.

ANAHOLA RIVER AT 1,140-FOOT ELEVATION NEAR KEALIA, KAUAI.

Location.—About 8 miles northwest of Kealia, Kauai, and 60 feet above the lower falls.

Records available.—March 28 to December 31, 1912.

Gage.—Inclined staff; read at irregular intervals; datum unchanged.

Channel.—Rock; probably permanent.

Discharge measurements.—Made by wading.

Discharge measurements of Anahola River at 1,140-foot elevation, near Kealia, Kauai, in 1912.

NOTE.—Miscellaneous gage readings obtained when observer was in vicinity of station.

ANAHOLA RIVER ABOVE DAM AT KIOKALA, NEAR KEALIA, KAUAI.

Location.—About one-fourth mile above the dam at Kiokala and 6 miles northwest of Kealia.

Records available.—August 22, 1910 to December 31, 1912.

Gage.—Inclined staff installed August 22, 1910; datum unchanged. Friez automatic gage was carried away by a flood November 2, 1910, and the station relocated at the dam at Kiokala on December 15, 1910, where it was maintained until December 28, 1912, when equipment was moved back to its first site about one-fourth mile above the dam, and Friez automatic register was installed.

Channel.—Bed of stream rocky and permanent.

Discharge measurements.—By wading and from footbridge.

Cooperation.—Station maintained in cooperation with the Makee Sugar Co.

Discharge measurements of Anahola River above dam at Kiokala near Kealia, Kauai, in 1912.

^a Ditch was dry Apr. 17-25. Mean for April is the mean of 21 days when ditch carried water.

^b No record June 22-28; clock register out of order. Mean for June is the mean of 23 days.

^c Mean for year is mean for 350 days.

KALIHIWAI RIVER BASIN.

KALIHIWAI RIVER NEAR KILAUEA, KAUAI.

Location.—About 2 miles southwest of Kilauea, at an elevation of about 600 feet, about 5 miles above mouth of river and one-half mile below Hoopouli Falls, and is reached by saddle horse on trail from Princeville plantation.

Records available.—August 21 to December 31, 1912.

Gage.—A vertical staff gage; read once each day; hour of reading irregular.

Channel.—Practically permanent.

Discharge measurements.—Made by wading.

Cooperation.—Station maintained in cooperation with the Princeville plantation.

The following discharge measurement was made by W. V. Hardy:

August 21, 1912: Gage height, 6.22 feet; discharge, 33.9 second-feet.

Daily gage height, in feet, of Kalihiwai River near Kilauea, Kauai, for 1912.

[Kakimoto, observer.]

a Mean for January is mean for 15 days.

b Mean for year is mean for 351 days.

LUMAHAI RIVER BASIN.

LUMAHAI RIVER NEAR WAINIHA, KAUAI.

Location.—About 4½ miles west of Hanalei and 300 feet below the point at which the Kauai Electric Co.'s power line crosses the river.

Records available.—March 24 to December 31, 1912.

Gage.—Staff; datum unchanged.

Channel.—Rocky; probably permanent.

Discharge measurements.—Made from wire suspension bridge.

Discharge measurements of Lumahai River near Wainiha, Kauai, in 1912.

Date.	Hydrographer.	Gage height.	Dis-charge.
		<i>Feet.</i>	<i>Sec.-ft.</i>
Jan. 18	W. V. Hardy.....		74.7
Mar. 26	do.....	7.99	154
Aug. 16	do.....	a 8.08	107

a Dam was built about 125 feet below the gage during April, 1912.

NOTE.—Gage heights unreliable, not published.

WAINIHA RIVER BASIN.

WAINIHA RIVER NEAR WAINIHA, KAUAI.

Location.—About 2 miles south of Wainiha and just northeast of the Kauai Electric Co.'s power house.

Records available.—East Channel, February 25 to December 31, 1912. West Channel, December 30, 1911, to December 31, 1912.

Gage.—Inclined timber gages on both channels; read twice daily, 7 a. m. and 5 p. m.

Channels.—There are two large channels, the East Channel and the West Channel, and two gages have to be maintained to obtain the total flow of the river at this point; both channels rocky and probably permanent. The natives build fish dams at the point where the river divides above the stations, and these shift the water from one channel to the other.

Discharge measurements.—Made from wire suspension bridges over each channel.

Cooperation.—Stations maintained in cooperation with the Kauai Electric Co.

Discharge measurements of East Channel of Wainiha River near Wainiha, Kauai, in 1912.

Date.	Hydrographer.	Gage height.	Dis-charge.
Mar. 19	W. V. Hardy.....	<i>Feet.</i> 6.44	<i>Sec.-ft.</i> 6.6
25do.....	8.90	364
Aug. 23do.....	6.89	18.5

Daily gage height, in feet, of East Channel of Wainiha River near Wainiha, Kauai, for 1912.

[Kauai Electric Co., observer.]

WAINIHA CANAL AT INTAKE, NEAR WAINIHA, KAUAI.

Location.—At 700-foot elevation, just below the point of diversion and about 4 miles above the Kauai Electric Co.'s power house.

Records available.—August 1, 1910, to December 31, 1912.

Channel.—Probably permanent.

Cooperation.—Gage heights furnished by Kauai Electric Co.

The following discharge measurement was made by W. V. Hardy:

March 20, 1912: Gage height, 4.14 feet; discharge, 80.0 second-feet.

Daily gage height, in feet, of Wainiha canal at intake, near Wainiha, Kauai, for 1912.

[Kauai Electric Co., observer.]

a Head in inches on 12-foot sharp-crested weir.

b River fluctuating.

PUMPED WATER ON KAUAI.

Several small pumping plants on Kauai are used to pump underground water for irrigation at very dry times or to lift fresh water to higher elevations. At only one place, however, is pumped water from underground sources depended upon as a regular irrigation supply.

The McBryde Sugar Co. has five electric plants with seven pumps and two steam plants with two pumps which are used for pumping underground water from Hanapepe and Lawai valleys.

During 1912 the quantity of water pumped daily by this company averaged 25,600,000 gallons, or 39.6 second-feet. A large part of this water is lifted more than 400 feet.

DITCH SEEPAGE AND LOSSES ON KAUAI.

The following investigations of ditch seepage and losses have been made during the year at the request of plantation and power company officials:

Ditch and canal loss or gain, 1912.

Wainiha canal (Kauai Electric Co.).

Date and hour.	Location.	Discharge.	Loss or gain.
Jan. 27:		<i>Second-feet.</i>	<i>Second-feet.</i>
9 a. m.	6,000 feet below intake.....	67.3	
10 a. m.	6,225 feet below intake.....	66.6	-0.7
11 a. m.	6,490 feet below intake.....	64.3	-2.3
11.40 a. m. .	6,815 feet below intake.....	63.2	-1.1

4 p. m.	Flume No. 35.....	44.1	
4.50 p. m.	Flume No. 36, 2,900 feet below flume No. 35.....	42.1	-2.0

NOTE.—These measurements were made to determine leakage at flume No. 36.

ISLAND OF OAHU.

PALOLO STREAM BASIN.

WAIOMAO STREAM AT 900-FOOT ELEVATION¹ NEAR HONOLULU, OAHU.

Location.—About 3 miles above Pukele in the Palolo Valley and about 9 miles from Honolulu.

Records available.—October 10, 1911, to December 31, 1912.

Gage.—Watson weekly clock register above 3-foot sharp-crested weir; datum uncertain on account of leaks under weir.

Channel.—One channel at all stages; shifting.

Discharge measurements.—By wading.

Diversions.—None above station; proposed to divert all of low-water discharge by pipe line for Honolulu water supply in 1913.

Accuracy.—Records poor, owing to uncertainty regarding leakage around and under the weir.

Discharge measurements of Waiomao Stream at 900-foot elevation, near Honolulu, Oahu, in 1912.

WAIOMAO STREAM ABOVE PUKELE STREAM, NEAR HONOLULU, OAHU.

Location.—At Pukele highway bridge in Palolo Valley, about 6 miles east of Honolulu.

Records available.—April 8 to December 29, 1911, and May 15 to December 31, 1912.

Drainage area.—Not measured.

Gage.—Vertical staff; read once daily, about 9 a. m.; datum unchanged.

Channel.—One channel at all stages; shifting.

Discharge measurements.—Low and medium stage measurements made by wading; flood measurements made from bridge.

Diversions.—None above station.

Accuracy.—Records poor.

MANOA STREAM BASIN.

MANOA STREAM AT UPPER END OF VALLEY NEAR HONOLULU, OAHU.

Location.—Below confluence of two main branches in upper Manoa Valley, about 5 miles east of Honolulu.

Records available.—November 7, 1910, to December 31, 1912.

Gage.—Vertical staff; read twice daily, about 6 a. m. and 5 p. m.

Channel.—One channel at all stages; shifting.

Discharge measurements.—By wading at low and medium stages up to a gage height about 4 feet; above this stage from footbridge at gage.

Diversions.—Several small irrigation ditches divert from the branches of the stream above the station.

Accuracy.—Records poor.

Discharge measurements of Manoa Stream at upper end of valley, near Honolulu, Oahu, in 1912.

MANOA STREAM AT COLLEGE OF HAWAII, NEAR HONOLULU.

Location.—In ravine about half a mile southeast of College of Hawaii, and 3 miles east of Honolulu.

Records available.—March 23, 1909, to November 24, 1910; November 1, 1912, to December 31, 1912.

Gage.—Vertical staff; read twice daily, at 6.30 a. m. and 5. p. m.; weir destroyed by flood November 24, 1910; several changes in datum previous to 1912.

Channel.—One channel for all stages; practically permanent.

Discharge measurements.—By wading.

Diversions.—One small irrigation ditch (maximum capacity about 1.5 second-feet), diverts water at a few hundred feet above the gage.

Accuracy.—Record good.

Cooperation.—Maintained in cooperation with the College of Hawaii.

Discharge measurements of Manoa Stream at College of Hawaii, near Honolulu, Oahu, in 1912.

Date.	Hydrographer.	Width.	Area of section.	Gage height.	Discharge.
		<i>Feet.</i>	<i>Sq.-ft.</i>	<i>Feet.</i>	<i>Sec.-ft.</i>
Nov. 23	A. R. Keller.....	18.0	30.2	2.28	43.8
Dec. 13do.....	12.1	7.82	1.07	2.19
20	G. K. Larrison.....	12.6	12.9	1.41	7.23

NOTE.—A ditch diverts water a few hundred feet above station. Discharge of ditch at time measurement was made=0.74; this gives total run-off for stream (7.23+0.74) 7.97 second-feet.

Daily gage height, in feet, of Manoa Stream at College of Hawaii, near Honolulu, Oahu, for 1912.

MANOA STREAM AT WAIALAE ROAD, NEAR HONOLULU, OAHU.

Location.—At Waialae road bridge, Honolulu, Oahu.

Records available.—November 5, 1910, to February 6, 1911, and June 15 to September 30, 1912, when station was discontinued.

Gage.—Vertical staff; read twice daily, at 6 a. m. and 4 p. m.; new datum established June 15, 1912.

Channel.—One at all stages; practically permanent.

Discharge measurements.—At low water made by wading; at flood stages from bridge.

Diversions.—All low-water discharge diverted above station.

Accuracy.—No discharge rating obtained for new datum.

The following discharge measurement was made by G. K. Larrison:
September 18, 1912: Gage height, 3.18 feet; discharge, 0.

Daily gage height, in feet, of Manoa Stream at Waialae road, near Honolulu, Oahu, for 1912.

Day.	June.	July.	Aug.	Sept.	Day.	June.	July.	Aug.	Sept.

					31.		3.40	4.15	

NOTE.—Station was abandoned, as records had little value; a better location was found at the College of Hawaii, about half a mile upstream, and a station was reestablished at that place. (See p. 108.)

PAUOA STREAM BELOW KAHUAWAI SPRING, NEAR HONOLULU, OAHU.

Location.—Upper Pauoa Valley about 1 mile above Punchbowl and about 2.5 miles northeast of Honolulu.

Records available.—April 14, 1911, to December 31, 1912.

Gage.—October 17, 1911, to December 31, 1912, Watson weekly clock register; April 14 to October 16, 1911, staff gage.

Channel.—One channel at all stages.

Discharge measurements.—Between April 14 and October 16, 1911, current-meter measurements were made by wading; from October 17, 1911, to December 31, 1912, measurement was made by a 4-foot sharp-crested weir, which has been checked by meter measurements.

Diversions.—None above station.

Accuracy.—Records good.

The following discharge measurement was made by C. H. Pierce:

August 25, 1912: Width, 1 foot; area of section, 0.73 square foot; gage height, 0.12 foot; discharge, 0.57 second-foot.

Discharge, in second-feet, of Pauoa Stream below Kahuwai Spring, near Honolulu, Oahu, for 1912.

KAHUAWAI SPRING NEAR HONOLULU, OAHU.

Location.—Upper Pauoa Valley about $1\frac{1}{2}$ miles above Punchbowl and one-fourth mile above Pauoa Stream weir station, about $2\frac{1}{2}$ miles northeast of Honolulu.

Records available.—September 23 to December 31, 1912.

Gage.—2-inch by 2-inch heavy stake driven into pool of spring 10 feet above weir to measure head on weir; head read twice daily, at 6 a. m. and 6 p. m., by graduated stick.

Channel.—Spring boils up vertically in pool about 10 feet in diameter.

Weir discharge.—Weir is built between rock abutments on south side of pool about 15 feet from pool center; discharge computed by Francis formula for sharp-crested weirs with end contractions.

Accuracy.—Records excellent.

Discharge, in second-feet, of Kahuawai Spring near Honolulu, Oahu, for 1912.

NUUANU STREAM BASIN.

NUUANU STREAM AT KUAKINI STREET, HONOLULU, OAHU.

Location.—At Kuakini Street bridge, Honolulu, Oahu.

Records available.—November 15, 1911, to September 30, 1912, when station was discontinued.

Drainage area.—Not measured.

Gage.—Vertical staff; read twice daily, at 6 a. m. and 4 p. m.; no change in datum.

Channel.—One at all stages.

Discharge measurements.—At low-water stages made by wading; at flood stages from bridge.

Diversions.—All low-water discharge is diverted above station.

Accuracy.—Records fair.

The following discharge measurement was made by C. H. Pierce:

August 23, 1912: Width, 2.4 feet; area of section, 0.63 square foot; gage height, 0.18 foot; discharge, 0.24 second-foot.

Daily gage height, in feet, of Nuuanu Stream at Kuakini Street, Honolulu, Oahu, for 1912.

[Oshimo, observer.]

LULUMAHO DITCH IN NUUANU VALLEY, NEAR HONOLULU, OAHU.

Location.—About 500 feet east of spillway of upper Nuuanu Valley reservoir, about 7 miles northeast of Honolulu.

Records available.—September 2, 1911, to December 31, 1912.

Gage.—Vertical staff; read once daily, at 4 p. m.; no change of datum.

Channel.—One channel at all stages; shifting.

Discharge measurements.—By wading.

Accuracy.—Records fair.

Discharge measurements of Lulumaho ditch in Nuuanu Valley, near Honolulu, Oahu, for 1912.

LUAKAHA WEIR IN NUUANU VALLEY, NEAR HONOLULU, OAHU.

Location.—About 1 mile below reservoir No. 4 (main) in upper Nuuanu Valley, about 5 miles from Honolulu post office.

Records available.—January 1, 1910, to December 31, 1912.

Gage.—Head is measured in iron pipe set about 3 feet back of weir crest; read once daily, at 4 p. m.; no change in datum.

Channel.—Concrete aqueduct; permanent.

Discharge measurements.—4-foot sharp-crested weir of concrete with end contractions; check measurements made with current meter by wading.

Diversions.—Aqueduct diverts low-water flow from Luakaha Stream, including seepage from reservoir No. 4.

Cooperation.—Records furnished by department of water works, city of Honolulu.

Discharge measurements of Luakaha weir in Nuuanu Valley, near Honolulu, Oahu, for 1912.

Date.	Hydrographer.	Gage height.	Discharge.
Sept. 19	G. K. Larrison <i>a</i>	<i>Feet.</i> 0.195	<i>Sec.-ft.</i> 0.901
19do. <i>b</i>195	1.43
20do. <i>a</i>208	.964
20do. <i>b</i>202	1.50

a Measurements made through notch in concrete aqueduct at a point about 15 feet below the weir. Owing to roughness of bottom and sides of the aqueduct the water was very turbulent and the results obtained are uncertain.

b Measurements made at point in stream about 20 feet above intake and about 200 feet above weir. On Sept. 19 the weir formula (end contracted, sharp crested) gave a discharge of 1.14 second-feet; on Sept. 20 gave a discharge of 1.20 second-feet and 1.31 second-feet.

Daily discharge, in second-feet, of Luakaha weir in Nuuanu Valley, near Honolulu, Oahu, for 1912.

NOTE.—Weir has some velocity of approach, and discharge as published is probably too low; because of this velocity of approach the weir formula $Q=3.33 LH^{3/2}$ is used instead of $Q=3.33 (L-0.2H)H^{3/2}$.

WAIKANE STREAM BASIN.

WAIKANE STREAM NEAR WAIKANE, OAHU.

Location.—One-half mile above belt road highway bridge at Waikane, opposite house of Japanese gage keeper.

Records available.—January 27 to September 30, 1912, when station was discontinued.

Gage.—Vertical staff; read once daily, about 7 a. m.; washed out September 30, 1912, and not replaced.

Channel.—One at all stages; shifting.

Discharge measurements.—Made by wading.

Diversions.—Several above station.

Accuracy.—No discharge rating obtained.

Discharge measurements of Waikane Stream near Waikane, Oahu, in 1912.

KAILUA STREAM NEAR WAIMANALO, OAHU.

Location.—Three-fourths mile east of point on Waimanalo-Honolulu road, where road to rice mill leaves main highway; about 150 feet below intake at Wong Leong ditch.

Records available.—Gage heights and discharge measurements from November 12 to December 31, 1912.

Gage.—Vertical staff; read twice daily, about 7 a. m. and 4 p. m.; no change in datum.

Channel.—One at all stages; fairly permanent.

Discharge measurements.—By wading.

Diversions.—Wong Leong ditch diverts all low-water discharge at point 150 feet above gage.

Accuracy.—Record fair.

Cooperation.—Maintained in cooperation with the Kaneohe Ranch Co.

Discharge measurements of Kailua Stream near Waimanalo, Oahu, in 1912.

Date.	Hydrographer.	Gage height.	Discharge.

MAKAWAO STREAM NEAR WAIMANALO, OAHU.

Location.—One-fourth mile upstream from confluence of Makawao and Kaimi streams and 100 feet above intake of irrigation ditch on Waimanalo-Honolulu road about 12½ miles east by road of Honolulu, Oahu.

Records available.—November 12 to December 31, 1912.

Gage.—Vertical staff; read twice daily, at 7 a. m. and 4 p. m.; no change in datum.

Channel.—One at all stages; practically permanent.

Discharge measurements.—By wading.

Diversions.—Low-water discharge of two main branches is diverted into the Makawao ditch at points about three-fourths mile above station. An irrigation ditch diverts most of the low-water discharge at a point about 100 feet below the gage.

Accuracy.—Records excellent.

Cooperation.—Maintained in cooperation with the Kaneohe Ranch Co.

Discharge measurements of Makawao Stream near Waimanalo, Oahu, in 1912.

PUMP DITCH NEAR WAIMANALO, OAHU.

Location.—Below outlet pipe at pumping plant, about $1\frac{1}{2}$ miles north of plantation headquarters; Waimanalo plantation is about 15 miles east of Honolulu.

Records available.—November 1 to December 31, 1912.

Gage.—Vertical staff on right bank below pipe outlet; read twice daily, about 7 a. m. and 5 p. m., by water foreman.

Channel.—Clean, of stiff clay; permanent; one channel; banks covered with grass and small weeds; does not overflow.

Discharge measurements.—By wading.

Diversions.—This ditch discharges the water pumped from the Waimanalo Lagoon.

Cooperation.—Maintained in cooperation with the Waimanalo Plantation Co.

^a Diverts low-water discharge of headwaters of Makawao and Kaimi streams.

^b Diverts low-water discharge of Kailua Stream.

^c Diverts low-water discharge of Kawainui Stream.

^d Diverts part of low-water discharge of Waiahole Stream.

ARTESIAN WELLS.

Artesian wells play an important part in connection with the water supply of Honolulu and the irrigation of sugar cane.

Records have been kept, more or less continuously, of the heads of Oahu wells for the past 30 years. During this period the mean yearly head has dropped about 15 feet. During the past dry year the heads on the wells dropped so low that many wells became seriously impregnated with salt, and the supply was reduced to an alarming degree. However, this condition brought to the attention of the Territorial officials the great waste that has been going on for years from this source of supply. Mr. T. F. Sedgwick, who has been making an investigation of the Oahu artesian wells, reports that the entire supply from this source for the city of Honolulu from Diamond Head to Fort Shafter amounted in 1912 to about 55 second-feet, and of this about one-third was allowed to waste into the sea. The following table shows the monthly fluctuation of the wells under investigation during 1912:

Height of water (elevation in feet above sea level) in artesian wells on Oahu in 1912.

ISLAND OF MAUI.

West Maui.

KAHAKULOA STREAM BASIN.

KAHAKULOA STREAM AT KAHAKULOA, NEAR WAIHEE, MAUI.

Location.—About 13 miles northwest of Wailuku at trail bridge of Kahakuloa, below all diversions.

Records available.—August 27 to December 31, 1912.

Drainage area.—Not measured.

Gage.—Staff; datum unchanged.

Channel.—Probably permanent.

Discharge measurements.—Made by wading.

Accuracy.—Good.

Discharge measurements of Kahakuloa Stream at Kahakuloa, near Waihee, Maui, in 1912.

WAIHEE STREAM BASIN.

WAIHEE STREAM AT DAM NEAR WAIHEE, MAUI.

Location.—About 2½ miles west of Waihee at intake of Waihee canal.

Records available.—November 17, 1910, to December 31, 1912.

Gage.—Vertical staff; read twice daily; datum unchanged.

Channel.—Crest of concrete diversion dam.

Discharge measurements.—Made by wading and from footbridge. To get total flow of Waihee Stream add flow of Waihee canal to discharge at this station.

Accuracy.—Records at this point show amount of water passing over the diversion dam and do not include flow in Waihee canal.

The following discharge measurement was made by C. T. Bailey:

December 1, 1912: Gage height, 0.49 foot; discharge, 59.2 second-feet.

Daily gage height, in feet, of Waihee Stream at dam near Waihee, Maui, for 1912.

[Joaquin Santos, observer.]

KAUAULA STREAM BASIN.

KAUAULA STREAM NEAR LAHAINA, MAUI.

Location.—About 3 miles east of Lahaina, 200 feet above Kauaula ditch intake, which is the uppermost diversion.

Records available.—March 7 to December 31, 1912; also discharge measurements in 1911.

Gage.—Vertical staff; read twice daily, at 6 a. m. and 4 p. m.

Channel.—Practically permanent.

Discharge measurements.—Made by wading at low-water stages in Kauaula ditch, which carries all the normal flow.

Accuracy.—Records good.

Cooperation.—Station is maintained in cooperation with the Pioneer Mill Co.

Discharge measurements of Kauaula Stream near Lahaina, Maui, in 1912.

KAHOMA STREAM BASIN.

KAHOMA STREAM NEAR LAHAINA, MAUI.

Location.—About 3½ miles above Lahaina, 500 feet below small dam that diverts all low-water flow, and 125 feet above concrete dam for Pioneer Mill Co.'s upper ditch.

Records available.—August 3, 1911, to December 31, 1912.

Gage.—Vertical staff; read twice daily, at 7 a. m. and 3 p. m.; datum unchanged.

Channel.—Liable to shift.

Discharge measurements.—Made by wading.

Accuracy.—No discharge rating has been obtained.

Cooperation.—Station maintained in cooperation with Pioneer Mill Co.

The following discharge measurement was made by C. T. Bailey:

December 13, 1912: Gage height, 0.40 foot; discharge, 0.16 second-foot.

Daily gage height, in feet, of Kahoma Stream near Lahaina, Maui, for 1912.

[E. C. Bortfeld, observer.]

East Maui.**KOOLAU DITCH REGION.****KOOLAU DITCH NEAR KEANAE, MAUI.**

Location.—About 3 miles southwest of Keanae, at portal of tunnel extending from Keanae Valley to Alo Stream.

Records available.—January 1, 1910, to December 31, 1912.

Gage.—Vertical staff; read twice daily, at 6 a. m. and 6 p. m.

Channel.—Straight and probably permanent.

Discharge measurements.—Made from plank.

Accuracy.—Very good.

Cooperation.—Gage belongs to and records are furnished annually by East Maui Ditch Co.

The following discharge measurement was made by J. B. Stewart:

January 11, 1912: Gage height, 24.5 inches; discharge, 44.8 second-feet.

Daily gage height, in inches, of Koolau ditch near Keanae, Maui, for 1912.

SPRECKELS DITCH REGION.

HAIPUAENA STREAM NEAR HUELO, MAUI.

Location.—About 6½ miles by trail southeast of Huelo post office, about 400 feet below point where the Spreckels ditch joins the stream.

Records available.—December 18, 1910, to December 31, 1912.

Drainage area.—Not mapped.

Gage.—Vertical staff; read once daily, about 4 p. m.; datum unchanged.

Channel.—Rough and shifting.

Discharge measurements.—Made by wading; no equipment for flood measurements.

Accuracy.—A fairly well defined rating curve has been developed for ordinary stages.

Cooperation.—Station maintained in cooperation with East Maui Ditch Co.

Discharge measurements of Haipuaena Stream near Huelo, Maui, in 1912.

ALO STREAM NEAR HUELO, MAUI.

Location.—About 5 miles by trail southeast of Huelo post office, immediately below wagon bridge where Old Spreckels ditch trail crosses stream.

Records available.—December 18, 1910, to December 31, 1912.

Gage.—Vertical staff; read twice daily, about 5.30 a. m. and 5 p. m.; datum unchanged.

Channel.—Practically permanent.

Discharge measurements.—Made by wading.

Accuracy.—Gage heights at low stages may be affected by inflow from Spreckels ditch below the gage.

Discharge measurements of Alo Stream near Huelo, Maui, in 1912.

OOPUOLA STREAM NEAR HUELO, MAUI.

Location.—About 2 miles by trail southeast of Huelo, and about 400 feet above Spreckels ditch crossing.

Records available.—December 16, 1910, to December 31, 1912.

Gage.—Vertical staff; read once daily, at no regular hour; datum unchanged.

Channel.—Shifting.

Discharge measurements.—Made by wading.

Accuracy.—Fair.

The following discharge measurement was made by J. B. Stewart:

September 22, 1912: Gage height, 0.88 foot; discharge, 0.46 second-foot.

Daily gage height, in feet, of Oopuola Stream near Huelo, Maui, for 1912.

[John Pachero, observer.]

SPRECKELS DITCH AT STATION NO. 4, NEAR HUELO, MAUI.

Location.—About $6\frac{1}{4}$ miles by trail southeast of Huelo post office, and about 250 feet above junction with small tributary of Puohakamoa Stream.

Records available.—December 18, 1910, to December 31, 1912.

Gage.—Vertical staff; read once daily, usually between 3 and 5 p. m.; datum unchanged.

Channel.—Permanent.

Discharge measurements.—Made from log at gage.

Accuracy.—Records good.

Cooperation.—East Maui Ditch Co. assists in obtaining gage heights.

Discharge measurements of Spreckels ditch at station No. 4, near Huelo, Maui, in 1912.

Date.	Hydrographer.	Gage height.	Discharge.

NOTE.—Discharge based on two readings daily. A gage was maintained on crest of wasteway at this station to show the amount of water in the stream which was not diverted into the ditch at the weir. No discharge over the wasteway except as noted in the following table, showing gage height in feet. The zero of the gage is at the same elevation as the crest of the wasteway.

OPANA DITCH NEAR HUELO, MAUI.

Location.—About $8\frac{1}{2}$ miles west of Huelo by trail, 5 miles west of Lupi, and about half a mile below ditch intake.

Records available.—January 1, 1910, to December 31, 1912.

Gage.—Head on weir measured by graduated scale on reference point in weir pool.

Discharge measurements.—By 6-foot Cippoletti weir.

Cooperation.—Records are copies from office of Maui Agricultural Co., but weir is the property of East Maui Ditch Co.

The following discharge measurement was made by J. B. Stewart:

January 12, 1912: Gage height, 1 inch (head on weir); discharge, 0.58 second-foot.

Daily discharge, in million gallons, of Opana ditch near Huelo, Maui, for 1912.

NEW HAMAKUA DITCH AT STATION NO. 1, NEAR HUELO, MAUI.

Location.—About 1½ miles south from Huelo post office at lower portal of first tunnel west of Nailiilihæle Stream.

Records available.—July 25 to December 31, 1912.

Gage.—A reference point, on top of cement-lined ditch, from which measurement is made to surface of water; observations made twice daily, at 5.30 a. m. and 5.30 p. m.; datum unchanged.

Channel.—Permanent.

Discharge measurements.—Made from plank over ditch.

Cooperation.—Station maintained in cooperation with East Maui Ditch Co.

Discharge measurements of New Hamakua ditch at station No. 1, near Huelo, Maui, in 1912.

NEW HAMAKUA DITCH AT STATION NO. 3, NEAR HUELO, MAUI.

Location.—About 1½ miles south of Huelo post office, at lower end of iron flume crossing Kailua Stream.

Records available.—January 14 to December 31, 1912.

Gage.—A reference point, on top of cement-lined ditch, from which distance to water surface is measured twice daily, at 6.30 a. m. and 4.30 p. m.; datum unchanged.

Channel.—Permanent.

Discharge measurements.—Made from plank over ditch. During low stages the flow at station No. 2 is the same as that of No. 3. During high stages, in order to determine the amount of water overflowing the sides of the iron flume and dropping into Kailua Stream, it is necessary to measure the ditch above and below this flume.

Cooperation.—Station maintained in cooperation with East Maui Ditch Co.

Discharge measurements of New Hamakua ditch at station No. 3, near Huelo, Maui, in 1912.

NEW HAMAKUA DITCH AT STATION NO. 4, NEAR HUELO, MAUI.

Location.—About 1½ miles south of Huelo post office and immediately above flume crossing Oanui Gulch.

Records available.—January 14 to December 31, 1912.

Gage.—A reference point, chiseled in cement lining of ditch, from which distance to water surface is measured twice daily, at 6.30 a. m. and 4.30 p. m.; datum unchanged.

Discharge measurements.—Made from plank over flume. The difference between the flow at stations No. 4 and No. 3 gives low-water flow of Kailua Stream.

Cooperation.—Station maintained in cooperation with East Maui Ditch Co.

Discharge measurements of New Hamakua ditch at station No. 4, near Huelo, Maui, in 1912.

NEW HAMAKUA DITCH AT STATION NO. 5, NEAR HUELO, MAUI.

Location.—About $1\frac{1}{2}$ miles south of Huelo post office and immediately below flume crossing Oanui Gulch.

Records available.—January 14, to December 31, 1912.

Gage.—A reference point, chiseled in cement lining of ditch, from which distance to water surface is measured twice daily, at 6.30 a. m. and 4.30 p. m.; datum unchanged.

Channel.—Cement lined; permanent.

Discharge measurements.—Made from plank at reference point. Difference between flow at this station and station No. 4 equals the low-water flow of Oanui Stream.

Cooperation.—East Maui Ditch Co. assists in obtaining gage heights.

Discharge measurements of New Hamakua ditch at station No. 5, near Huelo, Maui, in 1912.

Date.	Hydrographer.	Gage height.	Discharge.

HAIKU DITCH AT PEAHI WEIR, NEAR HUELO, MAUI.

Location.—In Peahi about 5 miles northwest of Huelo post office.

Records available.—January 1, 1910, to December 31, 1912.

Gage.—Friez automatic clock register.

Discharge.—Measured by sharp-crested weir, 16½ feet long, with bottom and end constructions.

Cooperation.—Weir is property of East Maui Ditch Co.; discharge records are copied from records of Hawaiian Commercial & Sugar Co.

Daily discharge, in million gallons, of Haiku ditch at Peahi weir, near Huelo, Maui, for 1912.

MISCELLANEOUS MEASUREMENTS.

The following discharge measurement was made by J. B. Stewart on Koolau ditch at Alo division weir, near Huelo, Maui:

March 13, 1912: Width, 8.0 feet; area of section, 33.6 square feet; mean velocity, 4.12 feet per second; gage height, 1.51 feet; discharge, 139 second-feet.

PUMPED WATER ON MAUI.

Considerable water is pumped for irrigation by different plantations on the leeward side of Maui.

Figures showing the amount of water pumped each month by the Pioneer Mill Co. have been furnished to the United States Geological Survey. These data show the amount of underground water raised by eight pumps, seven steam and one electric, located in the vicinity of Lahaina. The measurements were obtained by means of pump displacement.

Monthly discharge of pump No. 1, station No. 1, Pioneer Mill Co., near Lahaina, Maui, for 1912.

ISLAND OF HAWAII.

HILO GROUP OF STREAMS.

WAILUKU RIVER NEAR HILO, HAWAII.

Location.—A short distance above Hilo Electric Light Co. power canal intake and about 2 miles west of Hilo.

Records available.—March 21, 1911, to December 31, 1912.

Gage.—Vertical staff and Barrett & Lawrence hydro-chronograph; datum unchanged since gage was established.

Channel.—Probably slightly shifting.

Discharge measurements.—Made from cable car 120 feet below gage.

Accuracy.—Results considered good.

Discharge measurements of Wailuku River near Hilo, Hawaii, in 1912.

HONOLULU RIVER AT KAIWIKI, NEAR HILO, HAWAII.

Location.—One-half mile north of Kaiwiki and 6 miles west of Hilo, at an elevation of about 1,425 feet.

Records available.—June 1, 1911, to December 31, 1912.

Gage.—Vertical staff and Barrett & Lawrence hydro-chronograph; datum unchanged since gage was established.

Channel.—Probably slightly shifting.

Discharge measurements.—Made from small footbridge 40 feet below gage.

Accuracy.—Results considered good.

Discharge measurements of Honolii River at Kaiwika, near Hilo, Hawaii, in 1912.

KAWAINUI RIVER AT PEPEEKEO, NEAR HILO, HAWAII.

Location.—At highway bridge on government road 7 miles north of Hilo.

Records available.—December 4, 1911, to March 30, 1912.

Gage.—Vertical staff; read twice daily, at 6 a. m. and 5 p. m.; datum unchanged.

Discharge measurements.—Made by wading at low water, and from highway bridge during high water.

Accuracy.—Records fair.

STATIONS NOS. 1, 2, 3, AND 4 AT PIHONUA, NEAR HILO, HAWAII.¹

Location.—About 1½ miles above Hilo, Hawaii, and about one-half mile north of Kaumanu Road.

Records available.—February 2 to April 18 and July 30 to August 28, 1912.

Gage.—Gage heights were depth of water measured from a reference point. New datum for station No. 4 on July 30; relation to former datum unknown. Regular gages numbered to tenths installed July 30, 1912. Gage No. 1 discontinued, as all water had been diverted for Hilo supply. Gage No. 2, zero of old gage: shank of nail at gage height 0.45 foot on new gage. Gage No. 3, zero of old gage: shank of nail at gage height 0.45 foot on new gage. Gage No. 4, old gage out; no relation determined between old and new gages.

¹ Stations Nos. 1, 2, 3, and 4 on streams not named.

Discharge measurements.—Made by wading.

Channels.—Fair; beds of streams composed of small cobbles and gravel; probably shifting.

Cooperation.—Maintained in cooperation with the county engineer of Hawaii.

a Channel dry.

STATIONS AT 2,700-FOOT LEVEL¹ IN THE FOREST BACK OF HILO, HAWAII.

The perennial streams of the island of Hawaii are in general restricted to two zones, one comprising an area about 10 miles wide in the Kohala and Hamakua districts, and the other, including an area about 12 miles wide, situated in the Hilo district between the South Branch of Wailuku River on the southeast and Maulua Gulch on the northwest.

The run-off from the Kohala-Hamakua district at ordinary stages is now diverted into ditches serving the sugar lands of the north coast of the island. It is proposed to divert the run-off of the Hilo district at an elevation above the 2,500-foot contour and deliver it by a high-line ditch to serve the semi-arid lands of Kau on the south side of the island. Limited funds have restricted operations so far to the area bounded by the South Branch of Wailuku River and the North Branch of Kawainui River. All the streams of this region originate on the east slope of Mauna Kea. Above the wet belt, comprising about 75 square miles, the surface is composed of porous lava rock that absorbs practically all the rainfall.

Ten rain gages, which are read at monthly and bimonthly intervals, are maintained at approximately 500-foot intervals of elevation from sea level to an elevation of 5,000 feet in this district.

STATION RECORDS.

Location.—On the line of a trail cut out approximately on the 2,700-foot contour, in the forest above Hilo, Hawaii, during September and October, 1911. The trail is about 12 miles in length, trends in a general northerly and southerly direction, and crosses 83 streams having appreciable channels, from the South Branch of the Wailuku to the North Branch of Kawainui River. A gaging station is maintained on each of these streams, whether perennial or not, at the trail crossing. Beginning at the South Branch of the Wailuku with No. 1 the stations are numbered consecutively northward to No. 87, except for a break of 6 numbers between stations No. 18 and No. 25. A camp maintained near the middle of the zone under observation is reached by a foot trail, $3\frac{1}{2}$ miles long, from the end of the Kaiwiki Homestead road.

Records available.—Stations 1–12, October 1, 1911, to December 31, 1912.

Station 12a, November 30 to December 31, 1912.

Stations 13–18, 25–26, October 1, 1911, to December 31, 1912.

Stations 27–41, September 28, 1911, to December 31, 1912.

Stations 42–47, September 26, 1911, to December 31, 1912.

Stations 48–50, September 31, 1911, to December 31, 1912.

Stations 51–52, October 7, 1911, to December 31, 1912.

Stations 53–65, October 10, 1911, to December 31, 1912.

Stations 66–68, October 21, 1911, to December 31, 1912.

Stations 69–74, November 13, 1911, to December 31, 1912.

Stations 75–86, November 14, 1911, to December 31, 1912.

Station 86a, November 18, 1912, to December 31, 1912.

Station 87, November 14, 1911, to December 31, 1912.

¹ Aneroid readings gave elevation of 2,500 feet. More accurate determinations made later by topographers of U. S. Geol. Survey gave elevations 200 to 280 feet higher. The correct elevation of the survey camp at station No. 80 is 2,750 feet.

Gages.—Vertical staffs. Two observers have been continuously employed to read these 83 gages twice a day, except at such times when it was impossible to cross the streams at high water. The men alternated trips, north and south from the camp, and different observers were employed at different times.

Discharge measurements.—Made by wading.

Accuracy.—The total run-off for 1912 for all the stations was found to be 179,000 acre-feet, and that part which was determined from the good stations amounted to 173,000 acre-feet, leaving only 3 per cent of the total that might be very much in error. Although the estimated discharge forms quite a large percentage of the total discharge for the 83 stations, the mean monthly discharge for all the streams is probably correct within less than 25 per cent. See also notes to daily discharge tables.

Discharge measurements at station No. 1 at 2,700-foot level, near Hilo, Hawaii, in 1912.

NOTE.—The above table gives the combined discharge in second-feet and run-off in acre-feet for the 81 stations at the 2,700-foot level above Hilo, Hawaii.

HAMAKUA GROUP OF STREAMS.

KAWAINUI RIVER, NEAR WAIPIO, HAWAII.

Location.—One hundred feet above intake of New Hamakua ditch and 6½ miles southwest of Kukuihaele.

Records available.—July 20, 1911, to December 31, 1912.

Gage.—Vertical staff; read twice daily, at 6 a. m. and 5 p. m.; datum unchanged.

Channel.—Practically permanent.

Discharge measurements.—Made by wading at low water and from footbridge 10 feet below gage during high water.

Accuracy.—No discharge rating has yet been obtained.

Cooperation.—Station maintained in cooperation with Hawaiian Irrigation Co.

Daily gage height, in feet, of Kawainui River near Waipio, Hawaii, for 1912.

NEW HAMAKUA DITCH AT MAIN WEIR, NEAR KUKUIHAELE, HAWAII.

Location.—Near head of ditch about 500 feet south of office of Hawaiian Irrigation Co. (Ltd.), at Kukuiahaele. This ditch diverts all run-off from the headwaters of the Wapio Basin below the upper Hamakua ditch.

Records available.—July 18, 1910, to December 31, 1912.

Gage.—Automatic clock register; datum unchanged.

Discharge.—Measured by weir consisting of six 5-foot panels, sharp crested, and with a good stilling basin above. Discharge measurements made in ditch below weir have checked weir discharge to within 2 per cent.

Cooperation.—The records for this weir have been furnished the Geological Survey by the Hawaiian Irrigation Co. (Ltd.).

Daily discharge, in million gallons, of New Hamakua ditch at main weir, near Kukuiahaele, Hawaii, for 1912.

KOHALA GROUP OF STREAMS.

KOHALA DITCH NEAR KOHALA, HAWAII.

Location.—The Kohala Ditch Co. maintains three weirs, which measure the discharge carried by Kohala ditch. This ditch picks up and delivers to the plantations on the north coast of Hawaii all the run-off at low and medium stages between the Honokane Gulch and the northwest point of the island below the 2,000-foot contour. The Kehena ditch collects most of the water above the 2,000-foot contour.

The Awini weir is in the east branch of Honokanenui Gulch at an elevation of 1,880 feet, and is on the southeast side of the gulch.

The Niulii weir is about 3½ miles south of Niulii, Kohala District, at an elevation of 1,000 feet, and is about 5 miles below the Awini weir.

The Hawi weir is about 1½ miles south of the Hawi Mill near the lower end of the ditch.

Records available.—Daily records of the flow of the Kohala ditch at the Awini and Niulii weirs have been kept by the Kohala Ditch Co. since July 1, 1907. No daily record has been kept of the flow at the Hawi weir, which is used mainly as a check on deliveries of water between Niulii and Hawi. The Niulii weir measures the amount of water shown by the Awini weir, and also the inflow from the Honokanenui. The record for the Honokanenui is arrived at by subtracting the flow at the Awini weir from the flow at the Niulii weir.

Gages.—Vertical staffs graduated to hundredths and set in at the weirs.

Discharge measurements.—Each weir consists of three 5-foot panels with end contractions, sharp-beveled steel crest, and very slight velocity of approach.

Daily discharge, in million gallons, of Kohala ditch at Awini weir, near Kohala, Hawaii, for 1907.

Oct. 19	Tailrace, Hilo Electric Light Co.....	Hilo.....	25.00

RAIN GAGING.

The yearly rainfall of the Hawaiian Islands is extremely variable, ranging from a few inches at several low-level leeward localities to more than 400 inches, usually at elevations above 2,000 feet and on the windward sides of the islands. Valleys lying on the same sides of the islands and within a few miles of each other may have a variation in mean annual precipitation of several hundred per cent. The rainfall may also vary greatly at different elevations in the same valley. As a rule, the zone of heaviest precipitation is on the windward sides of the islands, at elevations 2,000 to 3,000 feet above sea level.

Generally the daily rain gages maintained by the United States Weather Bureau are located at low levels. Lack of funds and the absence of inhabitants at high-level localities have prevented the maintenance of Weather Bureau stations at high levels, although daily records for a number of places, are furnished that bureau by occupants and caretakers of mountain houses, ranches, etc. The data furnished by the Weather Bureau are, therefore, generally of little value in their relation to stream run-off.

When high levels are accessible and, in so far as funds are available, high-level rain gages, which are read monthly or bimonthly, have

been established by the Geological Survey and valuable records have been obtained. To accurately determine the precipitation of the Territory would require the installation of many more gages and the construction of many miles of trails.

Acknowledgment for cooperation in furnishing rainfall data is due to the following: Kauai—E. A. Knudsen, Kekaha Sugar Co., Makee Sugar Co., Hawaiian Sugar Co., Koloa Plantation, Grove Farm Plantation, W. F. Sanborn, of Princeville ranch, and A. Menefoglio, of Kauai Electric Co.; Oahu—E. E. Miller and F. Meyer; Maui—George Gibb, E. Brecht, H. B. Penhallow, David Fleming, Honolua ranch, Hawaiian Commercial & Sugar Co., S. E. Hubbard, and E. Brecht; Hawaii—Hawaii Mill Co., P. W. P. Bluett, James Henderson, George F. Whittemore, W. S. May, and C. F. Clark.

The following tables show the precipitation at stations maintained by the Geological Survey and give precipitation data furnished from private sources which are not included in United States Weather Bureau records, to which those interested in further data are referred:
